25th Annual Summer Agricultural Institute
June 8 - 12, 2015
SPONSORS
The Summer Agricultural Institute is a program of the University of Arizona College of Agriculture and Life Sciences Cooperative Extension.

It is funded by the Arizona Foundation for Agricultural Literacy through generous donations from individual members and organizations:

A Tumbling T Ranches
Agri-Business Council of Arizona
Anderson-Palmisano Farms
Arizona Cattle Industry Foundation
Arizona Farm Bureau
Arizona Grain Research & Promotion Council
Arizona Grown
Arizona Milk Producers
Arizona Nursery Association
Bales & Bales II
Briggs & Eggers Orchards
Buckeye Valley NRCD
Condor Seed Production, Inc.
Desert Tree Farm
Duncan Farms
Ecologic Solutions
Edible Phoenix
Farm Credit Services-Southwest
Farmers Investment Co.
Lakin Milling Company
Maricopa County Farm Bureau
Mountain States Wholesale Nursery
Otto & Edna Neely Foundation
Chris and Monica Pastor
R & S Farms
SAI Alumni 2010: Cheri Stegall
SAI Alumni 2011: Jill Barteau
SAI Alumni 2014: Dwight Valencia
SAI Alumni 2014: Susan Tennant
George and Barbara Seperich
SRP Community Outreach
Tempe Farming Co.
The Kemper & Ethel Marley Foundation
Wellton-Mohawk Valley NRCD
Whitewater Draw NRCD
IN-KIND CONTRIBUTORS
In-Kind Contributors are organizations, companies, facilities or individuals that have donated resources to support the Summer Agricultural Institute. This could be in the form of providing a staff person to help on the planning committee, hosting a site visit, sponsoring a meal, covering the cost of printing or transportation, or sponsor any of the various other components of the program. Any and all program support is greatly appreciated and we’d like to take this opportunity to thank the In-Kind Contributors of the 2015 Summer Agricultural Institute Program:

Alcantara Vineyards
Arizona Agribusiness & Equine Center, Inc.
Arizona Beef Council
Arizona Crop Improvement Association
Arizona Department of Agriculture
Arizona Milk Producers
Arizona State Cowbelles
Bonnie Plants
Chino Valley High School/Cooper Ag Center
Cloverleaf Ranch
Dairy Council® of Arizona
Diablo Trust
Edible Phoenix
Farm Family Hosts
Four Forest Restoration Initiative
Gila River Community Project
Grosetta Ranch
Heiden Land and Cattle
Knorr Farms
Maricopa County Cattlewomen
Maricopa County Farm Bureau
Mortimer Family Farm
Pendley Apple Homestead
Perkinsville Meat Processing
Rousseau Farms
Salt River Project
Triple G Dairy
U of A Cooperative Extension, Maricopa County
U of A Maricopa Agriculture Center
USDA Arid Lands Agricultural Research Center
Yavapai Community College Agribusiness & Science Technology Center
Yavapai Cowbelles
Arizona Grown

An agriculture commodity is something grown on a farm or a ranch. Milk, oranges, beef and cotton are agriculture commodities. This map shows all the major commodities grown in Arizona's 15 counties. There are 20,005 farms in our state.

Source: 2012 Arizona Agricultural Statistics Bulletin
www.nass.usda.gov/az/
Arizona’s agriculture ranks among the highest in the U.S. for several delicious products.

1. Arizona ranks #1 in:
   - Winter Lettuce & Alfalfa Yields (tons per acre)

2. Arizona ranks #2 in:
   - Lemons
   - Spinach
   - Broccoli
   - Cantaloupe
   - Cauliflower
   - Honeydew
   - Dairy Herd Size
   - Milk (lbs) per cow

3. Arizona ranks #3 in:
   - Tangerines

4. Arizona ranks #4 in:
   - Pecans
   - Oranges
   - Grapefruit

SAI 2015 - Week at a Glance

The Summer Agricultural Institute (SAI) is a highly interactive five-day tour designed to teach you about food and fiber production in Arizona and to help you incorporate that knowledge in the classroom. You will visit a variety of agricultural operations, spend an entire day at the University of Arizona's research farm, and have many opportunities to meet and talk with many people who live and work on modern day farms or ranches, or who are connected to agriculture in myriad ways.

SAI is an action-packed adventure that combines hands-on learning about agriculture with practical curriculum development. Throughout this week you will tour the following sites and hear from a variety of additional agriculture related organizations and people. This book is designed to help you make the most of your trip. Let us know how we can support your learning adventure this week.

**Monday**
- U of A Cooperative Extension, Maricopa County Welcome and Orientation Phoenix A
- U of A Maricopa Agriculture Center Knorr Farms Maricopa B
- USDA Arid-Land Agricultural Research Center

**Tuesday**
- Pendley Apple Homestead Sedona C
- Alcantara Vineyards Cottonwood D
- Grosetta Ranch
- Cloverleaf Ranch Camp Verde E
- Diablo Trust Flagstaff F

**Wednesday**
- Four Forest Restoration Initiative Flagstaff G
- Chino Valley High School/Cooper Ag Center Chino Valley
- Bonnie Plants
- Yavapai Community College Agribusiness & Science Technology Center

Summer Ag Institute - 2015
Week at a Glance
Monday, June 8, 2015

7:00 am  **A**  Registration/continental breakfast
*Hosted by Dairy Council® of Arizona* (pg 42)
*University of Arizona Cooperative Extension, Maricopa County* (pg 53)
4341 E. Broadway, Phoenix, AZ 85040
http://extension.arizona.edu/maricopa

7:30  Welcome / Introductions / Ag Quiz

8:15  Depart

9:00  **B**  University of Arizona Maricopa Agriculture Center (pg 54)
Mailing address: 37860 Smith-Enke Rd., Maricopa, AZ 85138
www.cals.arizona.edu/aes/mac
Welcome – Victor Jimenez
Insect Collection – Virginia Barkley
Siphon Tube Experience – Victor Jimenez

9:45  Depart

10:15  **C**  Knorr Farms - Chilies (pg 47)
Rob Knorr
Mailing address: PO Box 1260, Maricopa, AZ 85139

11:00  Depart

11:30  **B**  University of Arizona Maricopa Agriculture Center
Ag-Ventures - Victor Jimenez

12:00 pm  Lunch - *Hosted by Arizona Foundation for Agricultural Literacy (AFAL)*
Presentation: Biotech, What the Heck?
*Katie Aikins, Arizona Farm Bureau* (pg 38)

1:30  Insect Science (Group A, B) – Virginia Barkley
Plant Science (Group B, A) – Kelly Young

2:45  **D**  USDA Arid-Land Agricultural Research Center (pg 55)
Sustainable Agricultural Research
Mailing address: 21881 N. Cardon Ln., Maricopa, AZ 85138
www.ars.usda.gov/main/site_main.htm?modecode=53-47-10-00

3:45  Depart – processing time on the bus

5:00  **E**  Dinner – Cracker Barrel, Phoenix

5:45  Depart – processing time on the bus

6:45  **F**  Check into hotel – Comfort Inn
340 N. Goswick Way, Camp Verde, AZ

*Please Note:* Restrooms will be available at the following sites today:
*UA Cooperative Extension, Maricopa Ag Center, USDA Arid-Land Research Center, Dinner, Hotel.*
Monday, June 8, 2015
** * * * Journaling Pages * * * **

As you begin this week’s adventure, use these pages throughout the booklet to record your thoughts, comments, ideas, suggestions, etc. Think about how you may be able to use the information you are learning in your classroom and what additional resources you might need to help you impart this knowledge to your students. Throughout the week, there will be times planned for you to process your experiences and thoughts with each other in small groups and with the group as a whole. Refer back to these pages for those processing sessions - to remind yourself of your notes and to jot down ideas from your fellow teachers.

**MONDAY** - University of Arizona Cooperative Extension: Introduction, Ag quiz

Alcantara Vineyards

Welcome to Arizona Wine Country!

Alcantara Vineyards, the first winery on the Verde River, is one of the largest vineyards in Central and Northern Arizona. Alcantara Vineyards is located on 87 acres of sloping limestone at the confluence of the Verde River and Oak Creek; the only year-round flowing rivers in Arizona. The Verde River flows around the property and Oak Creek empties into the Verde River. It’s the perfect micro-climate for growing grapes and making Arizona wines!

Barbara Predmore, proprietress, states “the rocky limestone soil and sunny climate in the Verde is very similar to the wine making regions of France and Italy and after two years of experimentation the results are everything we hoped for and then some.” The Cliffs that border the Verde River basin have caves that were used by the Native Americans and petroglyphs have been found on some of the cave walls. This verdant river valley was also used for farming.

The vines that are planted are Merlot, Syrah, Sauvignon Blanc, Pinot Gris, Zinfandel, Cabernet Sauvignon, Viognier, Petite. Syrah, Charbono and Mouvedre. The vineyards are 3 years old, and we will have production on Merlot, Syrah, Sauvignon, Blanc and Pinot Gris this year... Take note of the roses planted at the end of the rows in our header photo? As long as those roses stay healthy, we know the vineyard is getting the right nutrients and are free of insects and diseases.

Our vineyards have over 13,000 vines and offer 12 different varietals. Come and try our red and white wines that will transform your taste buds into the relaxing world of wine tasting. Enjoy our surroundings which include the Verde River running around our property, with bald eagles flying overhead. Feel free to bring a picnic basket to enjoy our outside balcony and grass area.

Our high country vineyards, near Sedona Arizona are flourishing and make the perfect getaway when you are looking to enjoy Arizona wines in a spectacular setting. Just two hours from Phoenix and one of the best wineries near Sedona, Cottonwood and Jerome, Alcantara harvests wine in August and September, an event visitors are invited to watch... and don’t forget you can now buy Arizona wines online.
What is AAEC?
Founded in 1997, early college high school, Arizona Agribusiness and Equine Center, Inc., (AAEC) in partnership with Maricopa Community Colleges and now Yavapai Community College, is a multiple campus, independent college preparatory high school district. Each campus offers a rigorous college preparatory curriculum, and enables qualified Arizona resident students to earn college-transferable credits while completing work for their high school diploma.

AAEC Early College High Schools teach the Arizona State Standards in all core curricula and is accredited by the North Central Association of Schools and Colleges.
Currently, AAEC Early College High Schools is a thriving five-campus independent public high school district specializing in a college preparatory high school program with sites connected to Mesa Community College, Paradise Valley Community College, South Mountain Community College, Estrella Mountain Community College and now Yavapai Community College.

AAEC has a reputation in the Valley for preparing students of various academic backgrounds and abilities for college level studies in all disciplines. Remaining true to its origins, AAEC Early College High Schools continues to offer outstanding instruction in the sciences for students interested in careers in biotechnology, veterinary studies, equine science and agriculture-related fields. AAEC is focused on preparing students for future success. Our teachers work with industry partners to update and strengthen our curriculum. We also study labor projections to focus our offerings on professions which will be in demand in the future. Each campus is designed to provide educational choice for up to 500 high school students. The schools attract students and families from all over the Phoenix Valley who have many different interests. Alumni studies show that graduates pursue a wide variety of college majors. Independent status allows AAEC, through an open enrollment policy, to draw a wide range of students from across the city and state to its uniquely blended high school/college model.

AAEC College Preparatory High Schools Philosophy
AAEC pledges to provide all students with what they need to succeed:
- A superior academic program that meets students where they are academically and socially, and prepares them for college.
- Advanced coursework.
- Comprehensive student support services.
- Small classes and an intimate high school environment.
- An authentic college experience that allows students to enroll in college classes and participate fully in the life of the post-secondary partner.

Exceptional Faculty
AAEC Early College High Schools employ highly qualified instructors with substantial academic backgrounds as well as extensive professional experience. Our lower teacher to student ratio enables your child to have a personalized experience.
WHO ARE WE?
Congress created the Beef Promotion and Research Act, the “Beef Checkoff Program,” with passage of the 1985 Farm Bill. Producers approved making the Beef Checkoff Program mandatory in 1988, with 79 percent voting in favor of it.

PRODUCERS ASKED THE CHECKOFF PROGRAM BE BUILT ON THESE TENETS:
- All producers and importers pay the same $1-per head.
- One-half of the money collected by state Beef Councils – 50 cents of every dollar is invested through the Beef Council in each state.
- All national checkoff-funded programs are budgeted and evaluated by Cattlemen’s Beef Board, an independent organization of 104 checkoff-paying volunteers.
- Beef Board members are nominated by fellow state producers and appointed by the U.S. Secretary of Agriculture.

THE BEEF CHECKOFF ACTS AS A CATALYST FOR CHANGE...
The Checkoff doesn’t own cattle, packing plants or retail outlets. It can’t control prices or single-handedly turn around a bad market. The Beef Checkoff Program was designed to stimulate consumers to buy more beef. This is accomplished through a combination of initiatives including consumer advertising, research, public relations, education and new product development.

RESOURCES FOR TEACHERS
The Arizona Beef Council provides materials for classroom, presentations and ranch tours with topics including nutrition, the basics of the beef industry, food safety, beef byproducts, and the Arizona Cattle Industry all for FREE! Visit www.arizonabeef.org for more information.

OTHER USEFUL CHECKOFF FUNDED WEBSITES...
- www.befitswhatsfordinner.com - Helpful cooking tips and recipes
- www.explorebeef.org - Explains the story, environmental and economics of beef
- www.beefnutrition.org - All the nutrition information you need
- www.nationalbeefambassador.org - Opportunity for students to become ambassadors for beef
- www.zip4tweens.com - Helps kids and their families find a balanced approach to a healthier lifestyle.
- www.teachfree.com – Free, high-quality, downloadable educational materials for preschool -12th

For more educational questions or requests, please contact Tiffany Hayes at 602.273.7163 or tnhayes@arizonabeef.org
Arizona Cotton Growers Association

The Arizona Cotton Growers Association was created in 1944 to help in the recruitment of labor. Such efforts led to the development of the “Bracero” through which the Federal Government assisted with the importation of Mexican laborers to pick Arizona cotton until the advent of mechanical pickers.

Over the years, the Association has been engaged in a wide range of issues from farm programs to pest eradication (boll weevil, white fly, pink bollworm) to air quality.

The Arizona Cotton Growers Association is governed by a 50 member Board of Directors composed of cotton producers from across the State. The mission of the Arizona Cotton Growers Association “is to protect and improve the economic viability of the Arizona cotton producer.”

**Bounty from a Bale**

People often wonder how many typical items can be made from a bale of cotton. We present these examples of selected products which come from a 480 pound net weight bale. Figures are approximations.

Arizona Department of Agriculture

The Arizona Department of Agriculture is a cabinet-level statewide agency with 263 employees and an annual budget of more than $22 million. Our goal is to regulate and support Arizona agriculture in a manner that encourages farming, ranching, and agribusiness while protecting consumers and natural resources. The agency consists of three main divisions: Animal Services, Environmental Services, Plant Services.

The Department also includes a State Agricultural Laboratory; a Citrus, Fruit and Vegetable Standardization and Fresh Produce Grade Inspection program; and an Agricultural Consultation and Training program.

**Plant Services Division** - Protecting Arizona’s native plants. Ensure the public and the agriculture industry that dangerous plant infestations prevented or readily controlled. (Such pests include: gypsy moth, Mediterranean fruit fly, and imported fire ant, among others.)

**Animal Services Division**
We protect consumers from contagious and infectious disease in livestock, poultry, commercially raised fish, meat, milk, and eggs. We do this by enforcing laws concerning the movement, sale, importation, transport, slaughter, and theft of livestock. In addition, we conducting food quality and safety inspections of milk and meat products produced and processed in Arizona, and of egg and egg products produced in, or imported to, Arizona.

**Environmental Services Division**
Register and licensing feed, fertilizer, seed and pesticide companies or products in accordance with federal and state laws; Sampling for product quality to help protect the consumer; Enforce pesticide use compliance to ensure established buffer zones are adhered to, environmental concerns are met, and people are protected; Train and certify pesticide applicators and advisors. This includes the Worker Safety program, which is responsible for preventing or limiting farm workers exposure to pesticides.

**Citrus, Fruit and Vegetable Standardization**
The Citrus, Fruit, and Vegetable Standardization program monitors and enforces the quality standards for all fresh fruit and vegetables produced and marketed in Arizona. Citrus, Fruit, and Vegetable Standardization continues to support the state-wide gleaning program -- a collection of wholesome food for distribution to the poor and hungry. This program gathered and distributed over 40.3 million pounds of produce in FY 2009.

**Agricultural Consultation and Training**
The Agricultural Consultation and Training (ACT) Program is an innovative compliance assistance program unique to an agricultural regulatory agency. This program embraces the ADA’s goal of encouraging farming, ranching and agribusiness, while protecting consumers and natural resources by utilizing a non-enforcement approach. ACT is not affiliated with any of ADA’s enforcement programs, allowing staff members to provide a formal means by which the regulated agricultural community may request compliance assistance without regulatory intervention. ACT serves Arizona’s diverse agricultural community through the following compliance assistance and education programs: Pesticide Safety, Air Quality, and Agricultural Conservation Education.

ACT also houses the Livestock & Crop Conservation Grant Program, Specialty Crop Block Grant Program, AZ Citrus Research Council, AZ Iceberg Lettuce Research Council, AZ Grain Research and Promotion Council, Agricultural Employment Relations Board, and the AZ Agricultural Protection Commission.

**State Agricultural Laboratory**
We provide quality agricultural and environmental laboratory analysis, identification, certification and training services to various regulatory divisions of the Department and others as provided by law. To accomplish this mission, we are divided into Biology and Chemistry.
The National FFA Organization was organized as the "Future Farmers of America" in 1928 in Kansas City, Missouri. In 1988, the official name of the organization was changed to The National FFA Organization to reflect the broadening field of agriculture, which today encompasses more than 300 careers in everything from agri-science to biotechnology to turf grass management.

FFA operates on local, state and national levels. Student members belong to chapters organized at the local school level. Agricultural education instructors serve as chapter advisors. Chapters are organized under state associations headed by an advisor and executive secretary, often employees of the state department of education. States conduct programs and host annual conventions.

Through active participation in the FFA, members learn by taking part in and conducting meetings, speaking in public, participating in contest based on occupational skills, earning awards and recognition and becoming involved in cooperative efforts and community improvement. The FFA offers opportunities for becoming productive citizens in our democracy.

FFA members believe in leadership, citizenship, and patriotism. They believe in free enterprise—freedom under the law—in making their homes, schools, and communities’ better places in which to live and work.

Members participate in regular chapter meetings, present motions, debate issues, and take part in decision making. They work hard, but they also play hard, as recreation is also a part of each year's program of activities.
Arizona Farm Bureau

Arizona Farm Bureau is a grassroots organization dedicated to preserving and improving the Agriculture industry through member involvement in education, political activities, programs and services. The Arizona Farm Bureau is Arizona’s largest farm and ranch organization with membership that represents production agriculture throughout the state of Arizona.

Farm Bureau’s purpose is to be an independent, non-governmental grassroots organization that analyzes problems and formulates action to achieve educational improvement, economic opportunity, and social advancement in order to promote the financial and overall well being of agriculture and our members. We are the “Voice of Agriculture in Arizona.”

As the agriculture industry faces new challenges in the future, Farm Bureau will be there to assist our members in meeting those challenges. We will be involved in lobbying on county, state and national issues. We will be there to discuss issues of profitability, property rights, labor, water, trade, farm policy, tax issues, environmental issues and much more. We will also continue to offer value to our members by providing products and services.

We reach out to the public in many ways to teach them that their food, fiber and ornamentals come from farms and ranches, not from the store. Activities to promote agriculture to the public and the schools are also a focal point of the Farm Bureau.

Ag in the Classroom
The Arizona Farm Bureau Ag in the Classroom program strives to develop and implement curriculum and programs that are aligned to the state and core learning standards to help students and teachers be successful, while increasing agricultural awareness in K-6 classrooms and beyond.

Online Product Directory
Arizona Farm Bureau’s Fill Your Plate is an on-line direct market product directory. From apples to zucchini, and everything in between, Arizona’s farmers and ranchers will fill you up with the best knowledge of where your Arizona food comes from. Find locally grown products at www.fillyourplate.org.

Farm Bureau is local, county, state, national, and international in its scope and influence, and is non-partisan, non-sectarian, and non-secret in character. We are supported by dues-paying members, and we offer a myriad of services, discounts and benefits to our members.

Arizona has 13 active county Farm Bureaus covering all 15 counties. These are the basis of our grassroots organization. Each county Farm Bureau is an independent entity governed by local farmer and rancher volunteer leaders. All ideas, solutions, and leadership come from the members of the county Farm Bureau.
The Arizona State Cowbelles is a unified, professional organization made up of generations of Arizona women playing a vital role in the state’s cattle industry. The organization got its start in 1939 when a group of ranchers’ wives in the Douglas area formed a social club to cement good will and friendship among the wives and mothers of cattlemen in southeast Cochise County. The women named their organization “The Cowbelles.” The club immediately began doing charitable work.

Word of the unique organization spread quickly. The Wyoming State Cowbelles was formed in 1940. Texas women also asked permission to organize their own state Cowbelles. The Arizona State Cowbelles was formally organized in January, 1947, during the annual convention of the American National Cattlemen’s Association in Phoenix. Mattie Cowan, president of the original Cowbelles in Douglas, was elected the first state president. A total of 16 local Cowbelles groups have been organized around the state.

Over the years, the Cowbelles have turned their primary focus to beef promotion and public education about the nutritional value of beef and the lifestyle of ranch families. Arizona Cowbelles work hand in hand with the Arizona Beef Council to bring the message or ranching and the beef industry to their local schools, communities, and businesses.

Visit www.ArizonaCowbelles.org to find out more about the Cowbelles’ Scholarship Program or to contact the Cowbelles’ Officers and Local Presidents.
Bonnie Plants began in 1918 in the backyard of Bonnie and Livingston Paulk and has grown to include nearly 70 greenhouse locations around the country. We currently have around 500 sales representatives servicing more than 10,000 accounts throughout the United States with vegetables, herbs, and flowers. Throughout the company’s history, Bonnie Plants has brought top-quality plants to gardeners across the country.

Bonnie Plants is a family of gardeners who love to share the joys of vegetable and herb gardening with our millions of customers. Committed to green gardening, we provide products that are safe for the environment and easy to use. Our biodegradable pots have already prevented millions of pounds of plastic from entering landfills. Our commitment starts at our headquarters in Alabama, where we employ green growing practices such as sustainable energy production, reuse, and recycling.

Interested in flower, herb, or vegetable gardening? Bonnie Plants are distributed regionally, so your local plant nurseries will already have the best varieties for your area. We hope you’ll find this website to be a useful resource for gardening how-tos and information on caring for your vegetable and herb plants.

A Tomato Primer
Learn all about tomatoes, from start to finish. This e-book from garden expert and Bonnie partner P. Allen Smith acts as a tomato primer, covering basics on planting and growing, different options for supporting vines, best tomato varieties for containers, elements that make a tomato taste a certain way, best uses for different tomato types, the low-down on heirloom vs. hybrid, and more. [www.bonnieplants.com/library/tomato-primer/](http://www.bonnieplants.com/library/tomato-primer/)

Heirloom Vegetable Growing Tips
Raising a crop of heirloom veggies isn’t all that different from growing non-heirlooms. Like all vegetables, each heirloom plant requires sun, consistent moisture, and fertile, well-drained soil to grow and yield a healthy crop. But it’s also helpful to know where the plant originated. For the best chance of success, try these heirloom vegetable growing tips: [www.bonnieplants.com/library/heirloom-vegetable-growing-tips/](http://www.bonnieplants.com/library/heirloom-vegetable-growing-tips/)
Cooper Ag Center
Chino Valley High School

The Cooper AG Center offers students of Chino Valley High School's FFA program the experience needed which prepares them for the agriculture industry.

*From AZ Farm Bureau blog:*

**Local FFA Chapter Wins Arizona Agriculture’s Stewardship Award**

By Julie Murphree, Arizona Farm Bureau, Nov 25, 2013

Chino Valley FFA received the Arizona Farm Bureau Environmental Stewardship Award at a recent awards ceremony celebrating farmers and ranchers and Arizona agriculture throughout the state during their 92nd Annual conference at the Scottsdale Resort and Conference Center.

“Like so many other FFA chapters throughout Arizona, Chino Valley FFA is dedicated to making a positive difference in the lives of students by developing their potential for personal growth, premier leadership and career success through agricultural education,” Says Arizona Farm Bureau President Kevin Rogers.

**Chino Valley FFA**

The Chino Valley FFA Cooper Agriculture Center provides agricultural and aqua-cultural education through the use of advanced facilities thanks to its many acres of farmland and its living history museum.

Officially named and dedicated in 2002, the Chino Valley FFA Cooper Agriculture Center annually serves more than 200 FFA students. Prior to the dedication, the 52-acre farm was divided into two pastures and traditionally flood irrigated.

As one of their water conservation practices, Chino Valley Agriculture students have spent the last 12 years converting this state-of-the-art teaching facility from traditional flood irrigation, on uneven ground, to center pivot and subsurface micro-drip irrigation through an NRCS cost-sharing program.

Students now have the ability to compare and contrast the various types of irrigation systems and watering techniques, which allows them to micro-manage each pasture and test plot on the property at precise levels. The students’ efforts have not only reduced their irrigation water needs by 75 percent, but have also spawned additional expansion and research into pasture grazing and range utilization.

Dairy Council® of Arizona
Arizona Milk Producers

Dairy Council® of Arizona is a nonprofit nutrition education organization funded by Arizona’s milk producers and is an affiliated unit of National Dairy Council®. We strive to provide you with the latest in nutrition research and educational materials to help make your job easier. We offer a wide range of scientifically based education materials for all age groups, from pre-school through adult audiences. As a leader in nutrition education services in Arizona, we provide information on current nutrition issues such as calcium needs, osteoporosis, hypertension, weight management, lactose intolerance, dental health, and general nutrition. All Dairy Council of Arizona nutrition education materials are based on the MyPyramid Food Guidance System. Some of our materials are also available in Spanish.

No school wellness policy can be complete without incorporating nutrition education into the plan. Dairy Council of Arizona provides nutrition curriculum packages for several grade levels, as well as other nutrition education materials you can use to help you implement the best wellness policy you can. Dairy Council of Arizona is proud to provide these award winning, age-specific nutrition education materials throughout the state at no charge.

Arizona Milk Producers is the advertising and promotion arm of the organization, dedicated to promoting the benefits of milk and dairy foods to consumers. One aspect of this promotion is to highlight the importance of agriculture in the state and how dairy farmers care for their land and animals.

Arizona’s dairy farmers are committed to providing you and your family with wholesome milk and dairy products. This commitment starts on the farm with top-notch animal care and extends across the supply chain - from the milk tanker trucks to the processing plant to the grocery store - to ensure that the dairy foods you enjoy each day are as wholesome and pure as nature intended.

Dairy farmers work hard every day to bring you fresh, great tasting, milk products. Most dairies are family-owned, and as active members of their communities, farm families take pride in maintaining natural resources. That means preserving the land where they live and work, protecting the air and water they share with neighbors, and providing the best care for their cows - the life-blood of their business.

Dairy Council of Arizona

Diablo Trust

Learning from the land and sharing our knowledge... So there will always be a West.

An Unlikely Alliance

The Diablo Trust was initiated in 1993 at a community gathering called by two northern Arizona ranch families — the Prossers of the Bar T Bar and the Metzgers of the Flying M. The families took this unique step in response to increasing pressures on the historic uses of these century-old homesteads and the ranches associated with them.

Members of these families, who had long worked to promote healthy ranchlands, now welcomed others who shared their concern for the environment and wildlife to combine their energy, skills, dedication, and willingness to work to deal with these pressures more effectively, openly, and collaboratively.

From that "opening up" of the management of these two ranches arose a cooperative effort in which the diverse members of the Diablo Trust have worked together to create research and educational programs that are earning attention and acclaim from around the West and beyond.

Today, the Trust, open to everyone, provides a forum for the community to actively participate in a land stewardship process with monthly meetings the second Friday of every month. The results of its efforts include improved vegetation, better habitat for wildlife and livestock, and the protection of open spaces. Additionally, the ranch lands provide “hands-on” proving grounds for new, collaborative land management ideas.

Projects

Through our Diablo trust collaborative learning process, we are evaluating the effects of management, recreation, climate, fire, and time on more than 400,000 acres of private and public lands. As we learn from the land, we also work to restore it.

The ranchlands provide "hands-on" proving grounds for new, collaborative land management ideas. Project areas include rural planning; education; wildlife; community outreach; land and watershed improvement; recreation; and science and monitoring. Each project area is administered by a Diablo Trust Working Group.

In 2010, with the collaboration of state and federal agencies representatives, we created the Collaborative Resource Operational Plan (CROP). This plan documents projects implemented on Diablo Trust lands including brush management, water improvements, prescribed burns, and facilities implementation. The CROP plan and project database helps facilitate the transition of in-coming and out-going agency personnel that work closely with us.
Four Forest Restoration Initiative

What is Four Forest Restoration Initiative (4FRI)?
The Four Forest Restoration Initiative (4FRI) is a collaborative effort (among the U.S. Forest Service, citizens, conservation organizations, researchers and state agencies) to restore forest ecosystems on portions of four National Forests – Coconino, Kaibab, Apache-Sitgreaves, and Tonto – along the Mogollon Rim in northern Arizona.

Ponderosa pine forests stretch almost continuously from the south rim of the Grand Canyon, across the Mogollon Rim, to the White Mountains in eastern Arizona. Presently, forests are overgrown with thickets of young, unhealthy trees that contribute to the threat of unnaturally-severe wildfire.

Why do we need a forest restoration initiative?
Recent wildfires, increasing in size and intensity never before witnessed, provide evidence of natural ecosystems in widespread decline. While fire has always helped shape the landscape, today’s fires are not those of the past; they are often hotter, more destructive and more dangerous to fight. In part, the reason for the difference is that many of today’s forests have unprecedented levels of flammable materials including: dense thickets of small trees, underbrush, needles and leaves.

The vision of the 4FRI is a restored forest that supports low-intensity surface fires and functioning populations of native plants and animals. The vision includes communities that are better prepared for and protected from unnaturally-severe wildfire, and sustainable forest industries that strengthen local economies.

4FRI GOALS
• Accelerate large restoration efforts to support natural fire regimes, healthy diverse forests and rangelands, and abundant populations of native plants and animals.
• Facilitate community fire protection and preparedness.
• Enhance local economies through the use of excess trees.
Gila River Pima-Maricopa Irrigation Project

In 1995, the Gila River Indian Community (GRIC) negotiated an annual funding agreement with the United States Bureau of Reclamation (BOR) to construct and operate an irrigation project. That same year, the Pima-Maricopa Irrigation Project (P-MIP) was organized and began planning the construction of the irrigation system. When completed, it is scheduled to service up to 146,330 acres of land. As a federally-funded project, P-MIP was required to prepare a Programmatic Environmental Impact Statement (PEIS) documenting the impact the project would make on Community lands. This was completed and submitted to BOR in 1997.

In the eight years since P-MIP completed the PEIS, it has built more than twenty-six miles of pipeline, rebuilt seven miles of canal, constructed nine miles of new canal and conducted more than ten environmental studies and planned and designed the Blackwater, Santan, Memorial and Westside reaches of the main delivery system. During fiscal year 2007, P-MIP will have three miles of existing canal under reconstruction and will begin constructing eleven miles of lateral pipeline in the Santan Ranch area. During fiscal year 2005, the first settlement water flowed through the P-MIP constructed system into the Memorial Area. In addition, the project works closely with the Gila River Indian Irrigation and Drainage District in preparing a plan for the agricultural development of the reservation.

Before P-MIP can actually construct the irrigation system, it must first design the system, gain the necessary National Environmental Protection Act (NEPA) clearances, gain rights-of-way and secure input from the Community and the public at-large. By the end of fiscal year 2005, P-MIP had completed all pipeline construction in the Memorial area and all of the pipeline along the northern boundary in District Six. NEPA clearances in the Santan area have been completed, with mitigating work for the Pima Lateral initiated in fiscal year 2007. By the end of fiscal year 2003, environmental assessments were completed for the Blackwater and Off-Reservation Pima Lateral. The requisite rights-of-way for the planned construction reaches in the Santan area have been secured. In addition, rights-of-way for ST-IC and Santan Ranch Laterals are completed.

When the Pima-Maricopa Irrigation Project is completed, it will have built more than 2,400 miles of canal, pipeline and laterals to irrigate up to 146,330 acres of Community land. What makes P-MIP unique is that it is the first irrigation project in the United States being planned and constructed by an Indian tribal nation through self governance. By so doing, it is setting the precedent that tribal nations across the country can do likewise.
Groseta Ranches

Groseta Ranches was started in 1922 by Peter Groseta, Sr. in Middle Verde, Arizona. Over the past 87 years, the original 25-cow ranch has grown into a 400 cow-calf operation that is run by Andy Groseta and his son, Paul. Currently, the third, fourth & fifth generations live at the ranch headquarters, located on the banks of the Verde River in Cottonwood, Arizona. Cottonwood is 20 miles southwest of Sedona and 100 miles north of Phoenix.

Cattle on the ranch are branded with the W Dart brand which was acquired when Pete Groseta, Jr. purchased the W Dart cow outfit from the Fain family in 1948.

The ranch consists of approximately 40 sections of deeded, private leases, state trust and Forest Service lands. A set of commercial crossbred cows consisting primarily of Angus, Hereford and Charolais cows runs on these 40 sections. In addition to these cattle, a small herd of Maine, Chianina, Angus crossbred cows are kept on irrigated pasture at the ranch headquarters and are used to produce a select number of club calves for local 4-H and FFA members.

**Land Management Practices**

The ranch uses a deferred rotation grazing management system. Cattle are rotated through pastures allowing a minimum of one growing season (12 months) of rest. This practice promotes healthy rangelands for the cattle and wildlife. The ranch has approximately 20 miles of pipeline to provide water to both cattle and wildlife. Water is provided by wells, springs, dirt tanks and the Verde River. At the ranch headquarters we have irrigated permanent pastures where the ranch horses are kept. Irrigation water is provided to the headquarters from the Cottonwood Ditch Association (CDA). The CDA has senior water rights on the Verde River with the first water rights being recorded on December 10, 1877.

**Ranch Management Practices**

Cows calve in the spring, and are weaned and sold in the fall or held over and sold the following spring; this depends on forage conditions. The top heifers are kept as replacement heifers, bred by natural service and calve as first-calf heifers at the headquarters before being mixed in with the rest of the herd on the ranch. Despite the many challenges facing the cattle industry, Groseta Ranches continually strives to improve the quality of cattle produced, while remaining a good steward of the lands the cattle are produced on. With our large land base, our program revolves around functional, easy going, low maintenance cattle. A keen eye is kept on market demand in order to stay in tune with the trends of today’s consumers. This diligence in selection and continual improvement helps us meet the needs of commercial producing beef for today's consumer.

Groseta Ranches W Dart Ranch, 625 S. Mingus View Dr., Cottonwood, AZ 86326

Knorr Farms

Knorr Farms, family owned & operated, is based out of Arizona with over 5,000 acres of farming land covering locations in the western part of Pinal County, Arizona City and our main farm and cooling facility located in Maricopa, Arizona.

Knorr Farms uses the state of the art drip irrigation system. By farming with drip verses furrow comes with several advantages such as, using the precise application of water, nutrients and other agro-chemicals directly to the root zone of the plants and allows us to optimize the growing environment and leads to a higher quality and quantity crop.

Knorr Farms specializes and are well known for the Jalapeño Pepper.

Over a course of a year, Knorr Farms will harvest over 25 million pounds of jalapeño peppers in several different types that range in temperature from sweet to hot.

To make Knorr Farms unique in the production of jalapeño pepper, Knorr Farms has developed and patented a “Pepper De-Stemmer”. With the development of our Pepper De-Stemmer, invented by Robert J. Knorr and John Victor, we feel sure that adding the use of the de-stemmer with our pepper harvester will make the harvesting and processing of the peppers go smoothly by cutting the time it takes to harvest the peppers, de-cap and move them into the cooler for shipping.

Knorr Farms also grows a variety of numerous products and commodities such as: red chilies, wheat, milo, corn, beans, cucumbers, melons and cotton. Knorr Farms also has had success in the past growing: tomatoes, onions, lettuce and potatoes.
Maricopa County Farm Bureau

Maricopa County Farm Bureau (MCFB) is a grassroots membership organization dedicated to promoting and defending agriculture in a county with nearly 4 million residents. A non-profit organization governed by an elected board of directors who are local agriculture producers, MCFB concentrates its efforts on four areas: representing agriculture in local and county legislative and regulatory actions; education and communication; member benefits and developing leaders for the agriculture industry.

MCFB is one of the 13 county Farm Bureaus that make up the Arizona Farm Bureau Federation.

Maricopa County Farm Bureau is an “umbrella” organization that covers all aspects of agriculture—large and small production facilities growing crops and animals from celery and cilantro to horses and shrimp, from dairy cattle to hay and zucchini. That’s why Farm Bureau calls itself “The Voice of Agriculture.”

As part of our educational outreach, our farmers read to students during Agriculture Literacy Week in November and respond to requests for classroom presentations by a real farmer. Our farmers are also seen in various media presentations that show the real source of food, fiber and ornamental plants.

Our Ag in the Classroom program brings presentations to your school to help your students learn about the plants and animals that provide all the food they eat, most of the clothes they wear, the materials to build their homes and the ornamental plants and trees that make their homes and properties beautiful.

MCFB originated the popular “How to Grow a Pizza” trace-back exercise that shows how many farms it takes to provide the ingredients for pizza. Schedule “How to Grow a Pizza” presentations for your school by calling MCFB at 602-437-1330.

MCFB also provided initial funding for writing and printing an accurate children’s book about Arizona agriculture entitled Arizona Agriculture: Bee’s Amazing Adventure. Call our office in early November to request a real farmer to read this book to your class during Agriculture Literacy Week! (And check your school library to see if it is available there.)
Welcome to Mortimer Family Farms, a popular Prescott area attraction formerly known as Young’s Farm, is bringing back the rich farming history of Dewey-Humboldt. Gary Mortimer started Mortimer Nursery & Landscape Company in 1987 when he moved to the Prescott Area from Phoenix. Sharla joined the family and business in 1996. Through the years they have grown not only their business, but also their family to include four children: Ashlee, Hayden, Kayla, and Kolten.

In 2003 they moved to Ash Creek Ranch where they raise Black Angus Cattle. Since then their love of farming has flourished and readied them to revitalize and bring back to life one of Arizona’s most recognizable premier farms located at the corners of Highway 69 & 169 in Dewey-Humboldt.

Made famous for our Sweet Summer Corn, we also grow a variety of other seasonal vegetables on our 300 acre farm made available in our Farm Store. Mortimer Family Farms is growing a variety of produce that will be available seasonally in our farm store.

Vegetables include: Sweet Corn, Pumpkins, Squash, Onions, and more! Our nursery also has trees, shrubs, flowers, landscape materials, and gardening supplies available for all your gardening needs.

2011 was very successful with many excited visitors to the farm. They enjoyed a Spring Festival, Corn Festival, Pumpkin Festival, and Christmas Event. The Mortimer’s will do their best to continue many of the traditions you have enjoyed in the past.

- Re-opening of the Farm Store, On-Site Nursery, and Seasonal Vegetable Stand
- The fields will be brimming with Sweet Corn, Summer Vegetables, and Pumpkins
- Sweet Corn Festival in August
- Pumpkin Festival every weekend in October
- Huge Corn Maze
- A beautiful shady park near the river is now available for private weddings and events.

Thank you for your continued support of Mortimer Nursery & Landscape Company. It is because of the many years of community support and fantastic customer service staff, Mortimer Family Farms is becoming a reality!
Pendley Apple Homestead

Apples and Rangers Unite
by Hank Vincent, Park Ranger

The apple orchard at Slide Rock State Park has graced the property since 1912, when Frank Pendley established his first plantings. Apples were the primary cash crop of the Pendley family homestead. The homestead property became Slide Rock State Park in 1987.

For over a decade, orchard maintenance has been contracted out. In the spring of 2007 State Parks reacquired responsibility. The longevity of the historic trees and the quality of up coming harvests greatly depend upon ranger interaction. There are just over three hundred apple trees that require unwavering care and attention.

Winter in Oak Creek Canyon has brought freezing temperatures and taken the leaves from deciduous trees. With the apple trees entering dormancy, pruning has begun. Important objectives in pruning are: remove dead wood, admit sunlight and allow aeration, promote quality fruit, and shaping the trees for easier harvest and to allow passage. Cutting is done with loppers, handsaws and chainsaw. Three legged aluminum ladders are used to access high sections of tree. Each cut leads to the completion of a tree. Completion of each tree leads to a well-trained orchard.

Early spring brings blossoms and bud growth. Apple flowers are small, white with pink high lights and have an exquisite sweet aroma. With assistance from bees, other insects and wind the flowers are cross-pollinated. After fertilization, the petals will drop and apples will begin to take shape.

Spring is a fragile time for apples. A late freeze can kill the blossoms. This is also when the codling moth lays its eggs in the tree. The eggs hatch and become worms. The worms will eat the fruit and seeds. The codling moth needs to be monitored using pheromone traps. The trees must be sprayed with insecticide when moths are in greater numbers to prevent further infestation. As the apples grow thinning needs to occur. Thinning is the removal of excess fruit to improve size and quality of what is left on the tree.

During the long hot days of Arizona summer, fruit trees need irrigating. Electric pumps bring water from Oak Creek. Long aluminum pipe with sprinklers are set up to deliver water to each section of the orchard. With the trees well watered and thinned, the apples will continue to mature. Branches sagging under the weight of fruit need to be propped up with cull lumber. Harvest is both a laborious and rewarding time in an orchard. Picking usually starts in late August or early September. Indications of maturity are size, color, firmness and of course taste. Prematurely picked apples are chalky and bland. The familiar crisp crunch and classic sweetness of an apple is a most pleasing suggestion to pick. Caution must be taken while picking. Apples bruise easily. The fruit is sorted and boxed then taken to cold storage.

Slide Rock still employs the “Apple Packing Shed” built by Frank Pendley. The Pendley family used the shed to sort, polish, package and store their harvests. Harvest is celebrated with the Slide Rock Apple Festival. Activities include a pick your own apple program, games, entertainment, vendors and display booths. With a sigh of relief orchard clean up and preparations for next years crop begin. As ranger efforts continue, experience and training will expand the relationship between apple and human. These efforts enhance visitors’ experience and preserve historic integrity.

From: www.azstateparks.com/Parks/SLRO/feature.html
Rousseau Farming Co.

The Rousseau family has farmed in Arizona for four generations, dating back to the late 1800’s. Bill Rousseau was primarily involved in the cattle business with a feed lot in West Phoenix that he operated until 1982. His oldest son, Will, after graduating with a Bachelor of Science in Agronomy from the University of Arizona in 1979, worked with Bill for three years while starting his own farming operation. By 1986, Will was farming 1700 acres of row crops before experimenting with 40 acres of carrots. That same year the youngest son, David, another University of Arizona grad (‘83) returned after three years with the Farm Credit System to help form the Rousseau Farming Company partnership.

Founded in 1986, Rousseau Farming Company is a privately-held grower/shipper of vegetables and melons. It is one of the Arizona’s fastest growing produce companies. The company, with headquarters and growing fields in Tolleson, AZ, and additional farms in Scottsdale, employs a staff of approximately 500.

Today, the operation consists of over 10,000 acres, of which over 70 percent is vegetable production with the core crops being carrots, broccoli, onions, cantaloupe and watermelons. Rousseau Farming Company grows all these crops on a separate organic farm as well. The operation is vertically integrated with its own harvesting equipment, trucking, cooling, icing, processing and shipping facilities.

Will Rousseau has been active in the Arizona agriculture community and was elected to the Western Growers Board of Directors in 1993 and has served continuously since.
Triple G Dairy

Dairy cows are treated like queens on Arizona dairy farms and Triple G Dairy is no exception - it’s a high tech cow spa.

Owned and operated by the Gingg family, Triple G embodies four generations of dairy farming. Conrad Gingg grew up in the dairy business on his family’s dairy farm in California. His sons, Ben and K.C., run Triple G along with Ben’s children, Connie and Max who are part of the day to day operation of the dairy.

Cow comfort is an obvious priority at the facility as sophisticated computer controlled fans and misters adjust the atmosphere to keep the cows cool, while side curtains help keep the cool air inside. The milking parlor contains two state of the art milking carousels that each have 48 stalls and the cows even have a shaded walkway to get to the milking parlor. Triple G milks 3700 cows 3 times each day and combined with the young stock, the facility houses about 8000 animals.

Sustainability is also important for Triple G. Much of the feed is grown on the family’s 4000 acre farming operation and feed storage and mixing takes place right there on the grounds. A new methane collection system is in place and plans are in the works to actually generate their own power using the methane. Environmental issues are a key element as the family works to protect the soil and water to provide a good home for their cows, their families and their communities.
U of A Cooperative Extension
Maricopa County

Cooperative Extension plays a unique role in both urban and rural areas of the state. Extension provides practical information and education to help people make their lives better. Outreach efforts translate relevant University of Arizona research into effective practices people can put to immediate use in their homes and businesses.

Programs are conducted by the University of Arizona College of Agriculture and Life Sciences Cooperative Extension faculty in each county office and by campus-based Extension Specialists. Faculty members – Extension Agents – form partnerships with community groups and with trained volunteers to bring the university to the people.

Cooperative Extension programs address key quality of life issues pertaining to Animals; Environment & Natural Resources; Family, Youth & Community; Marketing, Trade & Economics; Nutrition, Food Safety & Health; and Plants.

Creating a Better Environment for Families and Consumers: Healthy people are better able to contribute to a robust economy. Cooperative Extension programs are designed to strengthen families, promote healthy lifestyles and wise financial decisions and develop community leaders. Programs are offered at community centers, churches, and other venues to reach diverse audiences.

4-H Youth Development: Youth ages 5-19 can be involved in more than 100 educational projects that are offered through 4-H. 4-H uses experiential learn-by-doing projects, meetings, community service and a variety of educational experiences to teach life skills while having fun. 4-H is young people and adults growing together to become informed, educated citizens.

Agriculture and Natural Resources: Extension promotes environmental stewardship through Horticulture, Field Crops, Turfgrass and Invasive Species programs. The Water Sustainability programs create quality interactive learning experiences to promote responsible water stewardship, including conservation.

Cooperative Extension has offices across the state, in counties and on Indian Reservations, that can be accessed through the web site cals.arizona.edu/extension. These offices are located in:

- Apache (St. Johns)
- Cochise (Willcox & Sierra Vista)
- Coconino (Flagstaff)
- Gila (Payson & Globe)
- Graham (Solomon)
- Greenlee (Duncan)
- La Paz (Parker)
- Maricopa (Phoenix)
- Mohave (Kingman)
- Navajo (Holbrook)
- Pima (Tucson & Sahuarita)
- Pinal (Casa Grande)
- Santa Cruz (Nogales)
- Yavapai (Prescott & Cottonwood)
- Yuma (Yuma)
- Colorado River Indian Tribes (Parker)
- Hopi Tribe (Keams Canyon)
- Navajo Nation (Window Rock & Shiprock)
- Hualapai Nation (Peach Springs)
- San Carlos Apache (San Carlos)
U of A Maricopa Agriculture Center

As one of the major centers of the Arizona Agricultural Experiment Station, the Maricopa Agricultural Center strives to be at the forefront of disciplinary field investigations, to develop, deliver and service the best appropriate integrated agricultural technologies for all problems faced by Arizona consumers and producers, and to provide assistance to all scientists conducting their research and educational outreach programs. The Center not only provides facilities and support for extension outreach programs, but also provides support and facilities for teaching University classes and Ag-Literacy to all age groups.

The MAC Farm Ag-Ventures educational programming includes a combination of videos, educational presenters, hands on learning experiences and trailer rides around certain parts of the 2100 acre farm for a first hand view of what makes a working plant farm work. Our philosophy is for students to learn and to have a fun time learning about the source of our food and fiber.

Nutrition Ag-Ventures - (September-October, March-May)
In this “food comes from the farm series”, students learn how many farms it takes to make a pizza. As pizza is the most popular item of choice among today’s youth, students learn about how plants grow and all the work it takes to bring healthy, nutritious food to the table. Classroom activities are provided to help further the Ag-Literacy experience.

Amazing Corn Festival - (October, November)
For thousands of years, corn has been a major staple in our diets. We have grown, ground, and gobbled it down! Students participate in a variety of educational activities ranging from harvesting, grinding and tasting corn products to corn art.

Desert Ag-Ventures - (January, February)
During the months of January and February, a special series titled ‘Desert Ag-Ventures’ opens up to let seniors and winter visitors learn about arid land agriculture. Most of the world’s agriculture takes place in arid environments, so this is a great opportunity for adults from around our nation and Canada to learn about and experience Arizona’s agriculture in a fun way.

Water & Science Ag-Ventures - (February)
Junior high school and high students participate in a cooperative effort with U.S. Water Lab research scientists, community supporters and MAC to learn about the science and technologies being applied in agriculture today. In addition to experiencing various rotating workshop presenters, students also get an opportunity to learn about aquaculture in addition to trying their hand as using siphon tubes in the fields.

Garden Ag-Ventures - (March, April, May)
Vegetables are an important part of our diet. Elementary students learn about nutrition, growing techniques, effects of weather, insects, & have the chance to harvest vegetables (depending on harvest conditions.)

For program reservations contact Victor Jimenez at (520) 568-2273 or vjimenez@ag.arizona.edu.
The U.S. Arid-Land Agricultural Research Center integrates the former Western Cotton Research Laboratory and the U.S. Water Conservation Laboratory on a 20-acre site at the University of Arizona, Maricopa Agricultural Center. The 97,000 ft² research center houses 26 research scientists and over 90 research and administrative support personnel. The mission of the research center is to develop sustainable agricultural systems, protect natural resources, and support rural communities in arid and semi-arid regions through interdisciplinary research. Research topics include crop management, integrated pest management, irrigation technology, remote sensing, water reuse, crop breeding and physiology, and global climate change. The facility opened in February 2006.

**Water Management and Conservation Research**

Irrigated agriculture is the major user of water in the western United States. While water is considered a renewable resource, it is often in short supply or of poor quality. Increasing demands are being made on limited water supplies by agriculture, cities, and industries. Thus, the objectives of the Water Management and Conservation Research Unit are to develop management strategies and physical hardware needed to attain the most efficient use of irrigation water, to protect groundwater in areas where agricultural practices would have the potential for degrading water quality, and to reuse wastewater.

Research Projects:
- Water Management in Arid Irrigated Agriculture
- Remote Sensing for Crop and Water Management in Arid Irrigated Agriculture
- Reuse of Treated Municipal Waste Water for Irrigation

**Plant Physiology and Genetic Research Unit**

The mission of the Plant Physiology and Genetic Research Unit is to increase the productivity, profitability and sustainability of agriculture in arid environments by developing new germplasm for both traditional and alternative crops and by improving plant responses to abiotic stresses and to changes in the global environment. Research is conducted under three major projects:
- Physiological and Genetic Basis of Cotton Acclimation to Abiotic Stress
- Commercialization of New Industrial Crop Germplasm and Cropping Systems
- Predicting Impacts of Climate Change on Agricultural Systems and Developing Potentials For Adaptation

**Pest Management and Biological Control Research Unit**

The mission of the Pest Management and Biocontrol Research unit is to develop unique and improved biological, behavioral, cultural, and genetic based methods to reduce losses by insects and mites affecting crops in arid land production areas of the U.S. The goals are economically, socially and environmentally acceptable pest population suppression technologies based on the use of behavioral chemicals, genetics, cultural practices, biological control, sampling and decision aids, modeling and population dynamics of pests and their natural enemies. Emphasis is placed on development of fully integrated, ecologically-based management strategies in a changing agricultural environment that includes recognition of the agriculture-urban interface.

USDA Arid-Land Agricultural Research Center

Yavapai College
Agribusiness & Science Technology Center

The Chino Valley Agribusiness & Science Technology Center houses courses in Agribusiness Technology, Animal Care & Management, Production Horticulture, Canine Care & Handling, Therapy & Service Dog Team Skills, Equine Practitioner, Electrical Utility Technology, and offers general education classes, including English, math and science.

YC’s Chino Valley Agribusiness & Science Technology Center programs offer students hands-on experience by putting them to work in state-of-the-art learning facilities. Thus, allowing students to learn in a real-world environment and preparing them for careers in specialized industries.

The main campus building is an award-winning “green” facility; Silver LEED (Leadership in Energy and Environmental Design) certification from the U.S. Green Building Council and the first community college in the nation to receive this award. This building minimizes environmental impact and takes advantages of the site upon which it is built with xeriscape landscaping, rainwater harvesting, solar water heating, a geothermal heat pump system, and energy management control system and other features.

The Chino Valley Agribusiness & Science Technology Center also includes computer commons, science lab, construction shop, exercise room, testing services, student support services, academic advising, career coaching and so much MORE!

One of the Best Fields for New College Graduates? Agriculture.

Nearly 60,000 High-Skilled Agriculture Job Openings Expected Annually in U.S., Yet Only 35,000 Graduates Available to Fill Them

WASHINGTON, May 11, 2015 — Agriculture Secretary Tom Vilsack today announced a new report showing tremendous demand for recent college graduates with a degree in agricultural programs with an estimated 57,900 high-skilled job openings annually in the food, agriculture, renewable natural resources, and environment fields in the United States. According to an employment outlook report released today by USDA's National Institute of Food and Agriculture (NIFA) and Purdue University, there is an average of 35,400 new U.S. graduates with a bachelor's degree or higher in agriculture related fields, 22,500 short of the jobs available annually.

"There is incredible opportunity for highly-skilled jobs in agriculture," said Secretary Vilsack. "Those receiving degrees in agricultural fields can expect to have ample career opportunities. Not only will those who study agriculture be likely to get well-paying jobs upon graduation, they will also have the satisfaction of working in a field that addresses some of the world's most pressing challenges. These jobs will only become more important as we continue to develop solutions to feed more than 9 billion people by 2050."

The report projects almost half of the job opportunities will be in management and business. Another 27 percent will be in science, technology, engineering, and mathematics (STEM) areas. Jobs in food and biomanufacturing production will make up 15 percent, and 12 percent of the openings will be in education, communication, and governmental services. The report also shows that women make up more than half of the food, agriculture, renewable natural resources, and environment higher education graduates in the United States.

Other highlights of the report include:

- While most employers prefer to hire graduates of food, agriculture, renewable natural resources, and environment programs, graduates from these programs only fill about 60 percent of the expected annual openings. Even as enrollments in these programs increase and the job market becomes somewhat more competitive, good employment opportunities for the next five years are expected.
- Growth in job opportunities will be uneven. Employers in some areas will struggle to find enough graduates to fill jobs. In a few areas, employers will find an oversupply of job seekers.
- Expect to see a strong employment market for e-commerce managers and marketing agents, ecosystem managers, agricultural science and business educators, crop advisors, and pest control specialists.
- Job opportunities in STEM areas are expected to grow. Expect the strongest job market for plant scientists, food scientists, sustainable biomanufacturing specialists, water resources scientists and engineers, precision agriculture specialists, and veterinarians.

The report, Employment Opportunities for College Graduates in Food, Agriculture, Renewable Natural Resources, and the Environment, United States, 2015–2020, is the eighth in a series of five-year projections initiated by USDA in 1980. The report was produced by Purdue University with grant support from NIFA.
USDA is an equal opportunity provider and employer. Great jobs news for the “college of solutions to the world’s most pressing problems”

It seems that everywhere we turn we are hearing "Henny Penny," sky is falling, doom and gloom stories about the future. Some news has a basis in fact, but many stories are driven by other agendas.

We can choose to spiral down in response to these reports or we can chose to spiral up. We can build a science- and fact-based future. We can choose a future in which our environmental, social and economic sustainability are not at odds but are linked to each other as three fundamental components of a self-reinforcing virtuous cycle. We can do this in Arizona and in the US and for the world.

And of course CALS is the college at the epicenter of the greatest opportunities.

Ian L. Maw, Ph.D., vice president of food, agriculture, and natural resources of the Association of Public and Land-Grant Universities, has analyzed the BLS data for some of the occupations for which we have undergraduate and graduate programs.

The data is telling. The BLS report shows that overall job growth is projected to be approximately 10% for the decade. For the occupation categories that Dr. Maw analyzed, however, workforce growth is substantially greater. This news is particularly timely as the college is working hard to get our new Veterinary Medical & Surgical Program established. The report shows that the US will need 44% more veterinarians in 2022 than it had in 2012.

With veterinary careers, and all of the careers listed here, we believe that Arizona’s students should have an opportunity equal to those of students in other states. Arizona’s economy should not be left out of the economic growth opportunity predicted for the rest of the US.

Here's Why We Haven't Quite Figured Out How to Feed Billions More People

Solving the world's looming food crisis will require big investments in agricultural research, yet public support for that is lagging.

By Dennis Dimick, National Geographic News

PUBLISHED OCTOBER 04, 2014

When famine loomed in Mexico and southern Asia in the mid-20th century, agricultural crop researchers saved the day. Scientists at Mexico's International Maize and Wheat Improvement Center (CIMMYT) and the Philippines's International Rice Research Institute (IRRI) came up with new, high-yielding varieties of wheat and rice that raised harvests and kept starvation at bay.

That major advancement in crop production—financed with money from governments and the Rockefeller and Ford Foundations—increased yields of cereal grains by using improved crop seeds, irrigation systems, synthetic fertilizer, and pesticides. Led by American agronomist Norman Borlaug, this movement became known as the Green Revolution.

Most increases in agricultural production during the past half century have come from that type of innovation: boosting crop and livestock yields on land that already was being used for agriculture. Studies indicate that this growth in productivity has stemmed largely from investments in agricultural research.

But yield improvements have slowed during the past 20 years, and public spending on agricultural research in developed nations such as the United States and those in Europe has flattened. That's a daunting combination at a time when the world's population is soaring toward 11 billion by 2100 and when several parts of the world—from California's Central Valley to Brazil's southern region around São
Paolo—are suffering through history-making droughts that have emptied reservoirs and damaged crops. More than 400,000 acres of food-growing lands have been left fallow in California.

A 2012 report in Science based on U.S. Department of Agriculture (USDA) data indicated that a decline in public support for agricultural research may be a factor in faltering yields and rising food prices. At the same time, investment in privately funded agricultural research—the kind that spawned patented pesticide-resistant genetically modified crops—has dominated the agricultural research landscape. The lesson: Biotechnology and better seeds provide a key piece of the puzzle in meeting future food demand, but alone cannot solve the challenge of feeding the world.

Calls for Revitalizing Agriculture Research

Worried about this decline in basic research and the flattening of yield growth, scientists and research groups are calling for renewed emphasis on—and financing of—publicly funded agricultural research. Donald Kennedy, editor emeritus of Science, wrote in the magazine's October 3 issue that "for decades the agricultural sector has suffered from neglect. If we want to combat new strains of pests that destroy crops, find new crop varieties enriched in nutritional value, improve yields, develop resistance to disease and drought, and provide environmentally sensitive cultivation practices, then agricultural research must be a priority. Why isn't it?"

"Over the past 35 years," he continued, "new ventures in U.S. public investment in agriculture research and development confronted a steady decline. At the same time, great advances in biochemistry, cell and molecular biology, and genetics were being made through increased funding to other agencies (besides USDA) for competitive-merit based research grants."

Kennedy also said that because of the regional or commodity-based "formula" method in which agricultural grants are allocated to the USDA, "agricultural research is now in a deficit position with respect to the infrastructure, human capital, and policies needed to address the challenges of food security."

Former USDA Secretary Dan Glickman, an advocate of increased public funding for agricultural research, recently was named chairman of the new Foundation for Food and Agricultural Research, which Congress has funded with $200 million for making research grants. Those grants must be matched with non-government money as the foundation's projects are identified. Congress's move represents a healthy contribution, but it also shows that the U.S. government's investment in the future of our food
supply remains a tiny fraction of the public financial support for health and medical research. The National Institutes of Health receives almost $30 billion annually for its research grant-making, 150 times more than the funding for the Foundation on Food and Agricultural Research.

The vital role of agricultural research in improving harvests and farmer prosperity dominated discussions last month at the first-ever gathering of CGIAR, a consortium of the world's top agricultural researchers. During a panel discussion that focused on the role of staple crops in meeting future food needs, Tim Searchinger of the World Resources Institute starkly framed the looming challenge.

Searchinger said that to meet the projected demand for food, unless we cut down all the world's remaining forests—which obviously is not a good idea—we must increase harvest on current farmland by one-third more than harvest were increased during the Green Revolution period of the 1940s through the 1960s. CGIAR is leading a renewed emphasis on agricultural research, and late last year announced $1 billion in new funding for research at its 15 centers.

Targeting Africa, Asia, and "Leverage Points"

Getting higher yields of corn and soybean from U.S. farms to feed more meat animals is not the problem. The main challenge for agricultural research is to get usable knowledge to farmers in places such as sub-Saharan Africa and southern Asia, so they can raise enough food for themselves and others, make money, and protect the land and water on their farms.

National Geographic Emerging Explorer Jerry Glover is working to achieve that in Africa by exploring integration of perennial legumes such as pigeon peas and groundnuts—plants that generate their own nitrogen fertilizer—into farmers' fields as a way to improve soil health and increase yields of food crops planted alongside the legumes. Glover's work at the U.S. Agency for International Development is part of Feed the Future, a U.S. government program designed to improve the harvests, and lives, of smallholder farmers.
Meeting the challenge of growing more food will also require targeting areas where additional research investment can be particularly effective in increasing productivity and protecting the environment.

Paul West and researchers at the University of Minnesota, in a July study in Science, identified "leverage points" in six countries that would allow enough food to be grown for three billion more people without trashing the planet. This study builds on an earlier study published in Nature, “Solutions for a Cultivated Planet,” that proposed a five-step plan for feeding the world in decades ahead while minimizing damage to the planet. National Geographic magazine featured this study in the article “Feeding Nine Billion” in the May 2014 issue, written by lead researcher Jonathan Foley.

Getting Knowledge "That Works"

Tim Folger writes in “The Next Green Revolution” in the October 2014 issue of National Geographic that the main challenge agricultural researchers face in helping farmers is not in creating low-tech or high-tech solutions to problems, but in providing appropriate knowledge "that works" and is useful to farmers on the land they farm.

Before we can better educate farmers about improved agricultural methods, we must identify what those methods should be. This is where low-profile, long-term agricultural research activities come in, projects and studies that create knowledge that help lead to successful harvests and prosperous farms.

Examples include more research into fruit, vegetable, crop, and livestock production; designing mobile phone networks to share market and production information; creative initiatives to capture and store water and irrigate fields; crop storage methods that trim the waste from harvests and protect grain from insects and rodents; solar-powered lighting; new and improved roads; and the creation of local purchasing cooperatives, financing strategies, and group markets to boost farmers' capital and revenue.

A new Green Revolution likely will hinge less on the kind of big research breakthroughs that defined the original Green Revolution and more on incremental examples like these that can work together and add up to better harvests and better lives for farmers.

Bruce Campbell, a CGIAR researcher, tells of Mary Ogello, a Kenyan farmer who was able to triple and quadruple her corn and sorghum harvests after researchers helped her access information about the start of rainy season and the likelihood of flood and drought on her land. Such thinking is part of a new approach called climate-smart agriculture that seeks to help farmers respond to climate change while reducing greenhouse gas emissions from agriculture that drive climate change.

Rice bowls used for three meals a day by Chinese factory workers speak to our ever-rising need for food: By 2050 we’ll have to grow enough food for more than 9.6 billion people, and by 2100 enough for a projected 11 billion.

PHOTOGRAPH BY JOHN STANMEYER, VII
A Rising Sense of Urgency

Food prices rose dramatically in late 2007 because of rising demand for grain-fed meat, faltering regional harvests, and increased diversion of corn crops for ethanol. Higher prices were good for farmers who sold crops, but around the world the rising prices hurt the least well-off who must buy food. There were reports suggesting that high food prices helped to fuel the social unrest of the Arab Spring in 2010 and 2011, but this remains a matter of debate. Regardless, despite projected ample grain harvests and lower prices this year, food prices globally have remained above 2010 levels ever since because of population and income growth, higher demand for food and grain-fed meat, extreme weather events affecting crops, and diversion of crops for biofuels.

The era of cheap food seems to be past, and as has been the case for a half century, food supplies and prices will be influenced by the effectiveness of agricultural research. When Norman Borlaug worked to develop high-yield "Green Revolution" wheat varieties more than 50 years ago, he was driven by a sense of urgency. We could all benefit by adopting his sense of urgency in making agricultural research a priority once again.

Dennis Dimick has degrees in agriculture and agriculture journalism from Oregon State University and the University of Wisconsin, and is National Geographic’s executive editor for environment. You can follow him on Twitter, Instagram, and flickr.

Largest Forest Service Restoration Initiative Reaches Milestone

WASHINGTON, April 20, 2015 – U.S. Forest Service Chief Tom Tidwell said today that the Four Forest Restoration Initiative (4FRI), the largest landscape-scale restoration initiative of its kind, has reached a pivotal milestone towards achieving accelerated forest restoration on more than 500,000 acres of the Coconino and Kaibab National Forests and grasslands in Arizona. Coconino National Forest Supervisor Earl Stewart and Kaibab National Forest Supervisor Mike Williams signed the final decision document for the project’s first Environmental Impact Statement on April 17th.

"The Forest Service is accelerating the restoration and management of our national forests, despite budgetary challenges, using innovative and collaborative strategies to work across large landscapes," said USDA Under Secretary for Natural Resources and the Environment Robert Bonnie, "The 4FRI project is one of the best examples of this approach, and we appreciate the hard work and participation of the many employees and partners who have worked to achieve this milestone."

"This is exceptional work of Forest Service employees and citizens who joined together to support this historic endeavor," said Tidwell. "This restoration work will contribute significantly to our efforts to sustain healthy, resilient landscapes. Support from these citizen groups will ensure we maintain this momentum for the long haul. That's what it will take to make a difference."

More than 30 stakeholder groups contributed significantly to the development of this phase of work, which also reflects public comments and input received throughout the process. Additional 4FRI restoration projects have already been and are being implemented across the Apache-Sitgreaves, Coconino, Tonto, and Kaibab National Forests.
Largest Forest Service Restoration Initiative Reaches Milestone

Forests. To date, approximately 300,000 acres have received some sort of restoration treatment as part of the initiative.

Chief Tidwell said signing the final "record of decision" for this phase of the restoration project is the result of four national forests and stakeholder groups joining together over five years to work on the largest landscape-scale restoration project ever analyzed in Forest Service history. This decision approves various restoration activities on over 586,000 acres of the Coconino and Kaibab National Forests including thinning; prescribed burning; watershed and road maintenance; grassland, spring, and stream channel restoration; and habitat improvements.

The 4FRI collaborative effort was started to restore forests ecosystems that support natural fire regimes, reduce the threat of destructive wildfire to nearby communities, and support sustainable forest industries that strengthen local economies.

4FRI represents unprecedented stakeholder engagement and participation. The 4FRI Stakeholders Group consists of individuals and groups representing local, county, and state governments; environmental groups, organizations, and institutions; and industry representatives. Their commitment to seeing these forests restored, and their continual engagement and participation throughout this process has been invaluable.

Restoring the health and resilience of our forests generates important values as well as economic benefits. 4FRI, and dozens of similar efforts, will help maintain a robust forest industry with benefits flowing not only to local communities but also to the Forest Service itself as the agency relies on local forest contractors and mills to provide the workforce to undertake a variety of restoration activities.

For additional information on the Four Forest Restoration Initiative visit www.fs.usda.gov/4fri.

The mission of the Forest Service, part of the U.S. Department of Agriculture, is to sustain the health, diversity, and productivity of the Nation's forests and grasslands to meet the needs of present and future generations. The agency manages 193 million acres of public land, provides assistance to state and private landowners, and maintains the largest forestry research organization in the world. Public lands the Forest Service manages contribute more than $13 billion to the economy each year through visitor spending alone. Those same lands provide 20 percent of the Nation's clean water supply, a value estimated at $7.2 billion per year. The agency has either a direct or indirect role in stewardship of about 80 percent of the 850 million forested acres within the U.S., of which 100 million acres are urban forests where most Americans live.

USDA is an equal opportunity provider and employer. To file a complaint of discrimination, write to USDA, Assistant Secretary for Civil Rights, Office of the Assistant Secretary for Civil Rights, 1400 Independence Avenue, S.W., Stop 9410, Washington, DC 20250-9410, or call toll-free at (866) 632-9992 (English) or (800) 877-8339 (TDD) or (866) 377-8642 (English Federal-relay) or (800) 845-6136 (Spanish Federal-relay)
While agriculture is a multi-billion dollar industry that directly affects everyone in the world each day, employers still struggle to find enthusiastic, qualified candidates. According to USDA, “between 2010 and 2015 there will be more jobs available in ag and food systems, renewable energy and the environment than qualified graduates to fill them.” With the industry booming – but college students being left uninformed about the importance of agricultural careers – the numbers need to increase.

Here are eight reasons that agriculture is needed now more than ever and to choose an agricultural career:

1. **Population is Increasing.** By 2050 the world’s population is projected to hit 9 billion people. To be able to feed and clothe the world, the population is going to rely heavily on agriculture. With that comes the need for new technology, hard workers, creative minds, and college graduates that are ready to get into the workforce and support this ever-changing industry.

2. **"New” generation of agriculture.** Baby boomers are in the primary agricultural leadership roles, but they are retiring at vast rates, leaving many positions un-filled. Employers are having difficulties finding the right talent to put into these positions and 60% of them are shifting their focus to recruiting college graduates.

3. **Job diversity.** Within the last 20 years, agriculture has expanded and become so diverse, giving job seekers a wide variety of careers to choose from. There are significant jobs in production, economics, marketing, agribusiness, technology, sales, finance, microbiology, communications, and much more. In 2013, there were 52,862 jobs posted on AgCareers.com containing differentiated career opportunities in every aspect of the agricultural industry!

4. **Shortage of college graduates in agriculture.** The truth of the matter is, there just are not enough people going into an agricultural related program of study causing a shortage of qualified job seekers. According to the AgCareers.com Enrollment and Employment Outlook Survey, less than 1% of college students are in an agricultural major. In 2013 there were 56,000+ career opportunities in the industry but only 29,000 graduates were trained to fill them.

5. **Industry growth.** Since the industry is growing at such a fast pace, there is high demand for qualified job seekers in every aspect of agriculture. The U.S. Department of Labor projects significant growth in selected food, renewable energy, and environmental jobs from now and throughout 2018. Even more, the Agribusiness HR Review shows that 60% of employers are planning to do more college recruiting within the next 1-5 years.
6. **Technology advancements.** Agricultural technologies are constantly evolving to help improve productivity. With the new technology, comes a need for job seekers with the right education to be able to work with and develop the technology that will continue to shape the industry.

7. **Increased salary.** To remain competitive and to secure the best talent in the industry, employers have been consistently increasing salaries. They have also offered better benefit packages to retain employees. Furthermore, qualified talent is being promoted now faster than any other generation has before.

8. **Rewarding.** Working in an agricultural related field is rewarding. You get the peace of mind knowing that you are making a positive impact on those around you. People that have careers in agriculture are passionate about what they do and want to see the industry be successful and prosperous. It’s rewarding to know that by working in an ag-related career, you are making a difference. Plus, the industry is an easy sector to network and make lasting connections with others in your field.

It is undeniable that the agriculture industry is one of the smartest career paths to take. Whether you are looking for a company that you fit in with, a competitive salary, or you want to make a difference, the agricultural sector has such a wide variety of jobs to choose from that it is easy to find what suits you best. It’s a growing field that needs new and talented employees to be ready to fill positions and be the next generation of agriculture.
Top 10 wineries in Arizona

Our Explore Arizona team picks their favorite wineries in Arizona including Dos Cabezas Wineworks, Arizona Hops and Vines, Caduceus Cellars and more.

Dos Cabezas Wineworks

Todd and Kelly Bostock co-own this winery that uses grapes grown in their Pronghorn Vineyard in nearby Elgin and the Cimarron Vineyard near Willcox. The 2009 El Campo was named one of the top 100 wines of 2012 by the San Francisco Chronicle. Bostock also makes and offers tastes of Cimarron wines, whose production is overseen by Oregon winemaker-turned-Arizona retiree Dick Erath.

Details: 3248 Arizona 82, Sonoita, 520-455-5141, doscabezaswineworks.com, $$-

Callaghan Vineyards

While he wasn't the first vintner in the region, Kent Callaghan's winery could be considered the place where the state's industry truly took root. His wines drew rave reviews from wine critic Robert Parker, raising the bar for other winemakers. It is no accident that so many vineyards started popping up near his. Arrive near closing time and you may spot other winemakers stopping by to talk shop with Callaghan. On the way here from Sonoita, you pass Rancho Rossa, and right next to Callaghan is Flying Leap. A little further down is the Tuscan-looking wine room of Keif-Joshua.

Details: 336 Elgin Road, Elgin, 520-455-5322, callaghanvineyards.com, $

Arizona Hops and Vines

Two sisters run this winery, which, thanks to a change in the law they lobbied for, will soon house a brewery as well. The field where the hops are growing is next to the vineyard. According to the sisters' tasting notes, most of the wines pair well with Cheetos.

Details: 3450 Arizona 82, Sonoita, 888-569-1642, azhopsandvines.com, $

Keeling-Schaefer Vineyards

The vineyard started nearly a decade ago in a remote area south of Chiricahua National Monument. The tasting room is in an old bank building in downtown Willcox. Its 2009 Three Sisters Syrah was the first Arizona wine to receive a rating of 89 from Wine Spectator. Across the tracks and well worth the short walk is Carlson Creek.

Details: 154 N. Railroad Ave., Willcox, 520-766-0600, keelingschaefervineyards.com, $

Zarpara

This tasting room is listed as being just 15 minutes from downtown Willcox, but that does not include the time you may spend checking directions and second-guessing yourself. Twelve miles and a few left turns take you to this location in Willcox vineyard country.

Details: 6777 S. Zarpara Lane, Willcox, 602-885-8903, zarpara.com, $

Page Springs Cellars

The only tasting room with a hostess stand and which, when crowded, uses those buzzers seen in chain restaurants to let you know your spot at the bar is ready. And that was before a Page Springs wine earned 90 points from Wine Spectator. Eric Glomski's flagship winery produces a wide variety of wines from its vineyards as well as some from select California properties. Cheese plates and appetizers available. Once here, you are close to both Oak Creek Vineyards and Javelina Leap. The winemaker at Javelina Leap, Cynthia Snapp, won a gold at the International Women's Wine Competition.

Details: 1500 N. Page Springs Road, Cornville, 928-639-3004, pagespringscellars.com, $

Arizona Stronghold Vineyards

The mass-market Arizona Stronghold wines are poured here, but the primary reason to stop by is to sample the small-production Site Archive bottles. These wines, made by Michael Pierce, are meant to be a living journal of the grapes grown at the various vineyards that make up Arizona Stronghold wines. Live music on Friday evenings. Once in downtown Cottonwood, you can hit Pillsbury Wine Co. and the Fire Mountain and Cellar Dwellers tasting rooms across the street.

Details: 1023 N. Main St., Cottonwood, 928-639-2789, azstronghold.com, $

Burning Tree Cellars

Burning Tree Cellars pours the work of "co-conspirators" Mitch Levy and Corey Turnbull. They get grapes from Arizona and California vineyards and turn them into small batches of wine with artistic labels. The tasting room, in a former car dealership, features a patio and music on weekend evenings. One of their wines, made with grapes from the Colibri Vineyard & Winery in southeastern Arizona, was one of the first two Arizona offerings to earn 90 points from Wine Spectator.

Details: 1040 N. Main St., Cottonwood, 928-649-8733, burningtreecellars.com, $

Caduceus Cellars

Caduceus Cellars is the label of Maynard James Keenan, lead singer of rock bands Tool, a Perfect Circle and Puscifer. Keenan, who lives nearby, makes wine using grapes grown on his property in the Jerome and Cornville areas. There are no seats in the tasting room, a result of town ordinances on parking spaces. Small-plate snacks are available. Open at 8 a.m. for espresso and coffee.

Details: 158 Main St., Jerome, 928-639-9463, caduceus.org, $-$

Four Eight Wineworks

A co-op of Arizona winemakers, this tasting room pours a selection from labels including Iniquius, Chateau Tumbleweed, Saeculum and Merkin. This is the first tasting room in downtown Clarkdale, a couple of miles northwest of Cottonwood.

Details: 907 Main St., Clarkdale, 928-649-2007, http://www.four8wineworks.com, $$
It is actually illegal in Colorado to collect the rain that falls on your home

By Jeff Guo March 24, 2015

Do you live in Colorado? Does it rain on your house? Do the drops patter off the roof, compose romantic puddles on your porch?

Guess what: That water isn’t yours. You can’t have it. And you most certainly cannot set out a tank to catch what falls from the sky, you thief.

Water laws are so strict in Colorado that rainwater collection is virtually prohibited. The doctrine is written into the state’s Constitution. All the rain is already spoken for. It belongs to someone, and that someone probably isn’t you. So don’t you touch it.

“The rain barrel is the bong of the Colorado garden,” local columnist Dave Philipps wrote in 2007. “It’s legal to sell one. It’s legal to own one. It’s just not legal to use it for its intended purpose.”

That might change soon, slightly.

On Monday, Colorado representatives voted to allow people to store up to 110 gallons of the rainwater that flows off their roof. One hundred gallons is on the high end of how much water a person in America uses per day. It’s about three tubs full of water, or four loads of laundry.

Rain barrel legalization will not save the world, nor even Colorado, where already the law against rainwater collection is rarely enforced. H.B. 1259 might not even pass Colorado’s Senate. But it’s a symbolic step toward a more modern way of thinking about water in America’s dry Western states.

In the West, water belongs to someone

The principle at stake is called prior appropriation, which is legalese for “first come, first served.” This doctrine forms the bedrock of water law in the Western states, where long ago settlers raced to gobble up all the water rights. Prior appropriation helps explain why water-intensive agriculture is still a major industry in a place as arid as the West: Many of the early claimants were farmers seeking to irrigate their crops.

These days, with drought parching the region, there’s hardly enough water to go around. According to the law, the people who get first dibs are the ones who called it first, which tend to be the agricultural users and not the city dwellers.

In Colorado, other people’s water rights even extend to the raindrops that fall onto your roof.

http://www.washingtonpost.com/blogs/govbeat/wp/2015/03/24/it-is-actually-illegal-in-colorado-to-collect-the-rain-that-falls-on-your-home
Why? Because those raindrops might tumble into the gutter; they might seep into the ground; might, in some other eventual, serpentine fashion, find their way to a river where somebody’s great-great-grandfather once established a claim.

Legal experts have long criticized the Wild West principle of prior appropriation. They say that the tradition of dibsies is incongruent with the way that people demand water in the 21st century.

“It’s this very rigid, very old system of water rights that hasn’t really changed that much in over a century,” said Reed Benson, a law professor at the University of New Mexico.

“Prior appropriation is so deeply embedded in Western water law,” said Robert Glennon, a law professor at the University of Arizona. “We academics criticize it but it’s not going anywhere.”

Benson has studied all the different ways that Western states have grappled with an increasingly stale idea like prior appropriation, which allocates water according to seniority instead of need. Bills legalizing rainwater collection are an example of how legislators have sought to carve exceptions into that way of thinking. (California passed a similar law in 2012.)

“There are a lot of good, practical, common-sense arguments in favor of a bill like this,” Benson said. “The fact that it’s controversial, the fact that it’s taken this long, shows you how well-entrenched that old tenacious legal system is.”

Whose idea was this, anyway?

Some laws are crafted by Congress; but the system of water rights in the West is a lesson in how customs can calcify into legal doctrine.

As the story goes, the dibsies approach to water management dates to the California Gold Rush. Flowing water has long been a gold miner’s best friend: As it cuts through the landscape, it picks up pebbles, dust, and occasionally, specks of something more precious.

These treasures end up naturally at the bottom of riverbeds, waiting to be sorted out of the sediment. During the 1849 Gold Rush, prospectors schlepped across the country to pan for those rare glints in California’s streams.

Miners of means sought to speed up the process. They set up high-pressure hoses to blast entire cliff sides. The runoff would flow through boxes that caught any gold fragments washed loose.

Hydraulic mining harmed the environment and placed exorbitant demands on a dry region’s water resources. The practice eventually fell out of favor, but not before it made a lasting impact on water law.

To feed their thirsty operations, miners dug channels that siphoned water from sources that could be miles away. They followed an apportioning rule carried over from mining principles. The first person to dig his canal was entitled to whatever water he carried away.

Eventually, Western states began to recognize and regulate this practice. They parcelled out permits to surface water in the order and quantities that people came to claim it. As settlers arrived to start irrigated farms on parched soil,
people continued to treat water as its own and separate property right: Just because you owned the land didn’t mean you owned the water.

The Eastern states, in contrast, were wet enough that they regarded surface water as a shared, inexhaustible resource (as in the common-law tradition, imported from soggy England). They did not keep tabs on how much water anyone took out of a river. People who owned land next to a river were free to use that river’s water in any reasonable fashion, as long as it didn’t affect their neighbors.

Though it’s maligned today, the system of prior appropriation suited the West’s arid climate. Unlike in the Eastern states, settlers could not rely on what streams, if any, ran through their property. They needed a legal system that allowed them to bring in water from far afield. Furthermore, water was scarce enough that it had to be measured out, which called for an orderly system of permits. These rights were given to those who would use the water productively — to irrigate a field, or to supply a mine.

In theory, prior appropriation made sure that water wasn’t wasted. People could not simply claim part of a river and divert it onto their property. They had to show that they had plans for the water, and that their plans did not interfere with the designs of the people who came before them.

Only then would they get rights to the water — and only enough water to serve their needs. As long as they continue putting the water to work, those rights are theirs forever.

Decades later, the unforeseen consequences

Fast forward 150 years to the present, when nearly every river basin has been burdened with claim on top of claim. Cue a record-breaking drought.

Prior appropriation has no provision for shared water conservation; the priority system is strict. During dry times, someone with a senior claim gets to suck down her full allotment. The people down the line might get nothing.

(In Colorado, she’s even entitled to the rain that falls onto her neighbor’s roofs. That rain, by law, must be allowed to flow unimpeded into the river for her to use.)

Critics say this system encourages waste. People with senior water rights don’t have any reason to cut back on their water use. (In practice the system is a bit looser, Illinois Institute of Technology law professor Dan Tarlock notes. It’s frowned upon to completely hog the water, even if someone has the legal right to do so. There’s some cooperation among growers.)

Consider the situation in California, where last week the governor imposed mandatory water conservation rules. Residents may not water their lawns more than a couple times a week. Restaurants can no longer serve water unless patrons specifically ask for it. If these measures don’t work, the state will consider punishing people with fines.

Yet, as the Economist noted last year, agriculture guzzles 80 percent of the water that California pumps, while representing only 2 percent of the state’s economic activity. Cities are responsible for most of the growth in the West, but irrigated farms still account for most of the water used.

Gov. Jerry Brown answers questions concerning the proposed $1 billion package of emergency drought-relief legislation during a Capitol news conference in Sacramento, Calif., on March 19. (Rich Pedroncelli/AP)
California Gov. Jerry Brown (D) has set a goal for homeowners to cut back on water consumption by 20 percent; but even if every suburbanite complies, the reduction would mostly be symbolic.

“There’s a strong push to conserve municipal demand in part to send a message, because that’s where the people are,” said Benson. “But also because that’s viewed as easier to accomplish. Agricultural water conservation is hard to do: in part because it’s expensive, and in part because the law doesn’t incentivize conservation.”

How to make water markets more liquid

It’s a tired refrain, but economic theory says that water, like any scarce resource, should go to the highest bidder.

“The water used to grow California cotton, for example, has much higher value producing silicon chips in San Jose or as drinking water in Los Angeles than it does as irrigation water,” George Mason economists Tyler Cowen and Alex Tabarrok write in their economics textbook.

Already this is happening a bit. Before he became a law professor, Benson was a lawyer in Colorado who specialized in helping cities buy water rights from farmers. “Markets are almost the only thing that gives prior appropriation a chance of making any kind of sense in the 21st century,” he said.

Colorado has a fairly robust system of trading water permits, though the agricultural industry has been reluctant to give up those rights. There’s even a derogatory phrase for those transactions: “Buy and dry.”

“The agricultural industry sees that as eroding their irrigated land base, taking away from their economy and their future,” Benson said.

But farmers who have inherited senior water rights could be sitting on fortunes, especially in drought years when they are the first ones in line for available water. Los Angeles is offering to buy up to $71 million worth of senior water rights, at top dollar. Just last week, rice farmers in the Sacramento Valley announced that they had sold some of their rights for the stunning price of $700 per acre-foot. (An acre-foot is roughly how much water a household uses in a year.)

That price translates into $2,100 per acre of rice that they don’t plant, KQED calculated. The profit on an acre of harvested rice? Maybe half that.

Los Angeles’s expensive water-buying spree illustrates one reason city residents need to conserve water; not because there isn’t enough out there, but because it costs a lot to buy water rights. The farmers who hold those rights tend to sell only as a last resort.

Robert Glennon, the law professor, believes that more farmers would participate in the market if they had more sophisticated ways of trading water rights.

“It’s critical to recognize that the cities and industry don’t need a huge percentage of agricultural water,” Glennon said. “But they do need a low single digit percentage.”

In a report for the Brookings Institution last October, he and co-authors Peter Culp and Gary Libecap suggest a menu of water contracts that farmers and cities could buy and sell.

“The perfect example is a dry year option, whereby a broccoli grower agrees not to grow broccoli in a dry season to let either a thirsty orchard producer or a city
use the water,” Glennon said. The broccoli grower gets paid every year, wet or dry, for a steady stream of income. The orchard producer gets insurance that he’ll have enough water for his almond trees, even during a drought.

“It’s a win-win,” Glennon said.

What does this all have to do with rain barrels?

In 2012, California passed a law allowing residents to capture and store the water that runs off their roofs. It used to be illegal in California to harvest the rain, but now cities like Los Angeles are handing out rain barrels for free.

Municipalities like rain barrels because they take pressure off city water systems. People don’t need treated, chlorinated water to quench their thirsty lawns anyway; rain works just fine.

The law used to be the only obstacle; collecting rain was technically illegal in many states because any precipitation was subject to that strict hierarchy of water rights stretching back to the mid-1800s.

But studies estimate that only a fraction of rain actually makes it to a river — less, during a drought. One influential 2007 report from Douglas County, Colo., estimates that only about 3 to 15 percent of rainwater returns to a stream system. Most of it is lost to evaporation, rising into clouds only to fall again later.

On the strength of that report, Colorado began a pilot program in 2009 that allowed people who got their water from wells to apply for rain collection permits. Yesterday, the house voted 45 to 20 to allow all homeowners to store up to 110 gallons of rainwater. HB 1259 now heads to the Senate.

Setting up a rain collection system takes at least a couple hundred dollars, and many households won’t find it cost-effective. But legalizing rain barrels in Colorado sends a twofold message to the state’s farmers.

On one hand it can be interpreted as a gesture of goodwill. Encouraging residents to collect the rain shows that municipalities care about their impact on the state’s water resources.

“One concern from the agricultural community is that farmers are getting a raw deal and that the cities are not doing their part,” Glennon said. “I often hear farmers say, ‘Well, why is a lawn in L.A. better than my alfalfa in Imperial Valley?’”

But the bill also signals that as Colorado’s cities grow, and as the political balance shifts, the legal custom of prior appropriation may be slowly renegotiated in favor of the urbanites. At the committee meeting last week, agriculture industry representatives strongly opposed HB 1259.

“It is a small step. And it’ll get bigger, and bigger, and bigger, until you dry up all of agriculture without buying it,” said Jim Yahn, a commercial water manager and farmer.

“At least the other way that we do it, farmers get compensated for the water that’s used. This is a small step in the wrong direction.”

Arizona honey bees are making a comeback

Arizona was once a hotbed of the honeybee industry, a place where bees were so plentiful they were sent by the truckload to states such as California, North Dakota and Washington to pollinate cherries, apples and almonds.

Up until the mid-1990s, more than 20,000 beekeepers kept honeybees in Arizona. That number has dwindled to about 5,600 beekeepers today, a result of a ravaged honeybee population. Mites, pesticides, drought, disease and a devastating phenomenon called colony collapse disorder have all left deep marks.

But nothing has dealt a blow as nearly fatal as the emergence 30 years ago of the Africanized bee, a small, ferocious foe that strikes fear in Arizonans' hearts and sent beekeepers packing to the far reaches of the state and beyond.

Arizona beekeepers have learned to take extraordinary steps to prevent the still prevalent African bee from taking over their backyard hives. The aggressive Africanized bee enters hives occupied by gentle European bees and takes over by killing the queen and rapidly repopulating.

Despite the challenges, the industry is making somewhat of a comeback in Arizona, say the men and women who nurture hives in their backyards. Beekeepers, people as industrious as their charges, have developed an array of solutions to help keep Arizona buzzing.

The mite is all but gone, and careful, hardworking beekeepers can prevent their hives from becoming Africanized, often with the help of Italian or other gentle queen bees.

"You have to be on your toes to combat them," Dowdy says of the aggressive Africanized bees who have taken over many of the hives of European bees in Arizona. Preventive measures include adding new European queens to hives and moving hives to areas with no water. (Photo: Mark Henle/The Republic)

"We've solved a lot of the problems," said Virl Dowdy, 79, considered by many to be the dean of Arizona beekeepers.

Such a comeback is good for Arizona, as beekeeping can be lucrative and funnel more money back into the local economy. On a larger, ecological scale, beekeeping is also good for the planet. Without bees, there is no pollination. Without pollination, plants and flowers will become extinct, too.
Arizona honey bees are making a comeback

African bee devastated Arizona's honeybee business

The African bee, also called the Killer bee, arrived in Arizona about 1993, experts say. It's not so much a freak of nature as a freak of overzealous breeding, a Brazil laboratory experiment gone awry when some queens escaped. Africanized queens mate three times more often than their European counterparts -- they even mate in the air -- and will repopulate a hive, rendering it useless as beekeepers can't harvest the honey without getting attacked. Africanized bees are also unusable for pollinating crops for profit.

The first Arizona fatality involving the aggressive bees was in 1995, when African bees fatally stung an 88-year-old Apache Junction woman. The most recent fatality was Oct. 8, when 800,000 killer bees in Douglas killed one man and injured three others. By the mid-1990s, African bees had terrified Arizonans and dominated many a hive. The state's last bee inspector declared the entire state Africanized. "The African bee scared everybody out," beekeeper David Meyer of Phoenix said. "A lot of cities had knee jerk reactions and banned bees." Beekeepers moved their hives to less populous places like Klondike, Wilcox, Buckeye, and even California and Oregon.

"This used to be one of the largest producing bee states," said Scott Clark, who owns the Beesville Bee Farm in Phoenix and makes Wild Flower Honey. "When Africanized bees came, we lost places to keep bees."

Arizona beekeepers ship bees to farms for profit

Before the near death knell, Arizona bees were shipped off by the plane and truckload to pollinate crops in other states, then shipped back to their Arizona owners. "Most beekeepers produced more bees than honey," said Clark. "That was the big income." It's still income, according to Dowdy and some others, but on a smaller scale.

Central California almond farmers now pay $200 per hive to pollinate crops starting in February. Less lucrative opportunities are available in Oregon, Washington, Utah, Washington, Idaho and North Dakota.

"One million hives go to Central California to pollinate almonds," said Meyer, who owns Mican-Meyer Farms. "About once a year, a semi-trailer (carrying bees) tips over, and bees get out. That's what that is."

The bees come back to their Arizona owners, then go on to pollinate another crop, Meyer said. Beekeepers get about $75 per hive from Yuma-area cotton and melon farmers, Meyer said.

Italian queens help hives

To prevent African bees from taking over hives, Dowdy said, Arizona beekeepers must regularly re-queen their hives with expensive European queens. "You have to be on your toes to combat them," Dowdy, who has kept bees for 40 years, said of African bees. Dowdy moves his hives to areas with no natural or irrigated water, because African bees are unlikely to be drawn there. Then Dowdy hauls in his own water. "Otherwise, African bees will take over (the hives)," Dowdy said.

Variations of this practice are becoming the norm in Arizona, but beekeepers acknowledge buying the imported queens is expensive. "It's a real hit to the bottom line," Meyer said.

Colony Collapse Disorder

But there is something else occurring called Colony Collapse Disorder, a phenomenon in which all the bees in a hive disappear.

Research from the Harvard School of Public Health supports a popular theory that a certain class of insecticides, neonicotinoids, seems to be the blame.

Colony Collapse Disorder is one of many challenges beekeepers in Arizona are grappling with. Beekeepers in the state have developed support systems and groups that allow them to exchange information and ideas.
At a recent monthly meeting of the Beekeepers Association of Central America, about 50 Phoenix-area beekeepers gathered to share tips and gain inspiration about their shared interest. The group's swelling attendance reflects the growing health of Arizona's honeybees, and the topics discussed reflect the intricacies of keeping bees.

A young man's earnest voice cut through the crowd. The bees of his third hive -- his biggest, strongest -- had begun to die. Instead of leaving the hive and flying off, they dropped dead to the ground. But it's the biggest and the strongest bees that forage the farthest, several of the old-timers responded. Chances are, they foraged to a field that had been sprayed with pesticide or herbicide. "When you aerial spray everything, because you have now planted a crop that is resistant to herbicide, that is not a good thing," Meyer said.

Bees another canary in the coal mine

Bees are an essential part of the world food supply. Nearly 80 percent of all commercial crops are pollinated by bees, according to most estimates. "If the bee disappeared off the surface of the globe, then man would have only four years of life left. No more bees, no more pollination, no more plants, no more animals, no more man," Albert Einstein is quoted as saying.

In "Silent Spring," published in 1963, author Rachel Carlson wrote about the impact of synthetic pesticides on insects and the food chain. In China, there are so few bee hives that instead of using bees to pollinate crops, some farmers use workers wielding pipe cleaners. "But hand pollinators do not make beeswax," said beekeeper Diane Campoy of Laveen. "Hand pollinators do not make honey. We need bees."

In Arizona today, more people who come across swarms or hives of unwanted bees are asking to have them removed without harm, Meyer said. "Bees get such a bad rap," Campoy said. "But when you think about it, bees are the only insects that actually feed man." On Alice Avenue between Central and 7th Avenues, Dave Krause's obvious affection for bees has proved contagious. Several neighbors have joined him in keeping backyard hives. Central Phoenix's plentiful water supply and mature and varied vegetation are a bee mecca.

"I love handling bees, even Africanized bees," said Krause, 73. "It does take a special person to work with bees. You have to have a determination, and a mentor." He was sitting with his mentor, Dowdy, in Dowdy's old-fashioned country kitchen in Central Phoenix, when the phone rang. It was a backyard beekeeper. Dowdy receives about a dozen such calls a day.

"Here in Arizona we've solved a lot of the problems," said Dowdy. "I think China could learn a little from us."

Dairying in the Desert

_Caballero sees weather as benefit, challenge of dairying in Arizona_

by Jennifer Burggraff

ELOY, Ariz. – Dairying in the desert does not sound appealing to most Midwest producers. But to Craig Caballero, the arid climate of central Arizona provides a nearly perfect dairy scenario.

“We battle the heat, but we’ve become very effective at it here in Arizona,” Caballero said. “... There’s four months where it’s tough, but I don’t know a better place to dairy than Arizona because of the dry, cool weather [the rest of the year].”

Caballero is the manager and an owner/partner of Caballero Dairy Farms near Eloy, Ariz., along with his wife, Heather. They have four children: John, Anika, Joseph and Ethan.

The dairy was started by Caballero’s parents, Manuel and Dorothy Caballero, in 1958 as a 90-cow operation in Mesa, Ariz. Since then it has grown to an 8,000-head (including youngstock, dry cows and milking cows) dairy based out of Eloy, about 45 minutes southeast of Phoenix in Pinal County. Fifty people are employed between the main dairy and their heifer raising facility, which houses calves from one day to one year old.

“Pinal County is a big dairy area,” Caballero said. “There are close to 100,000 dairy cows in the county, and the infrastructure is very dairy friendly.” That’s over half the dairy population in the entire state.

“Arizona is a very small dairy state, with only 150,000 to 170,000 milk cows,” he said. “About 98 percent of the dairies are within a 100-mile radius of Phoenix.”

Today the Caballero family has a mixed milking herd of 3,600 cows, almost twice the size of the average Arizona dairy. The herd is milked three times a day in a 72-cow rotary parlor, another fact that sets them apart from other Arizona dairies.

“There are around seven rotary parlors in the state. That’s less than 10 percent,” Caballero said. Part of that stems from the fact that they are also one of the newest dairies in the state, opening at the Eloy location in June 2006.

Being in a desert climate where summer temperatures average 108 to 110°F, with lows between 80 and 85°F, the Caballeros have learned to handle the heat. The Caballeros’ herd is housed in Saudi barns – large, high-roofed, composted bedded pack loafing sheds designed from the barns used in Saudi Arabia. Fans hang every 20 feet throughout the barn.

“We have to spend millions of dollars of capital investments in cooling [our cows],” Caballero said. “We don’t deal with humidity, but we have four to five months that we have to concentrate on cooling by fans, misters and overhead soakers to keep our milk production and reproduction. Dairies here are built around cooling and cow comfort.”

But while June through September are challenging, the rest of the year provides ideal temperatures for dairying. Winter temperatures average 65°F for the high and 30°F for the low, though Caballero has seen it drop
as low as 120°F in winter and get as hot as 120°F in the summer.

“Ninety degrees in Arizona is more comfortable than 90°F in Minnesota,” Caballero said. “It’s very dry here, and if there is any breeze, it’s not as uncomfortable as it sounds.”

While the fact that it’s dry helps with cow comfort and cow health, it does present a problem when it comes to growing crops. The average rainfall in Arizona is approximately 7.5 inches per year, Caballero said.

“Typically we get three-fourths of that in a three-month window. There are four to five months [out of the year] when it won’t rain at all,” he said. “We’re in the desert, so water is and always will be a huge problem and challenge.”

Because of this, all cropland in Arizona is irrigated. Producers have to purchase water rights for home and farm use. In many cases, water rights for irrigation are grandfathered in when a farm is purchased, Caballero said.

“There’s a lot of cost to water here,” he said. “... We have to do things here to make water last, to make the ground more efficient.”

One of those practices is laser leveling their land – discing fields so the water is evenly distributed throughout. Excess water is caught up in drains at the end of a field and recycled for the next field.

While part of their water supply comes from the summer rains, what they depend on for irrigation and farm use comes during the winter months, in the form of snow pack in the northern part of the state, which drains into their reservoirs.

But although it snows in the mountains surrounding the desert, Caballero has only seen it snow twice in the Phoenix area, averaging once every 15 to 20 years, he said. The last snow they got was in 2006, shortly after opening in Eloy.

The Caballeros raise around 2,000 acres of alfalfa and 1,000 acres of corn silage each year. The soil is mainly fertile clay with some sand, and because they are in a valley, the landscape is flat, surrounded by mountains. “Most dairies [in Arizona] have to purchase a majority of their feed,” Caballero said. “In our case, we are able to grow around 70 percent of our forages in house, but the other 30 percent we buy. We’re able to grow more than most.”

They also buy soybeans and corn each year, most of which comes from the Midwest. “Ultimately, we’re more dependent on purchasing than growing,” he said. In recent years, this has caused their cost of production to drastically increase.

“Since ethanol took off, our cost of production has gone up inherently,” Caballero said. “It costs us $1 to $2 more, and it’s directly feed driven.” The cost of locally grown feed has also increased with the cost of water.

“So between what we are able to grow and the cost of water, it’s been a struggle to stay efficient,” he said.

What has helped is their co-op, United Dairymen of Arizona (UDA), which represents over 90 percent of the milk in Arizona.

“We have a great co-op. They’re very agile and producer-friendly, and they are able to make good decisions quickly,” said Caballero, who serves on UDA’s executive committee. Their co-op has helped the Caballeros build their farm to what it is today: a prominent modern Arizona dairy.

“We’re currently concentrating on doing what we can to become as efficient as we can,” Caballero said about future plans. “We’ll do as well as we can, and when an opportunity comes about, we’ll take advantage of it. We’ll keep on working hard every day.”
Building a better pepper

By Ainslee S. Wittig/Aziona range news ---- January 27, 2010

Ed Curry found his passion in the chile fields of Southeast Arizona

Edward Curry's parents planted their first chile crop in 1957, and he grew up in those chile fields in Southeastern Arizona. "My Mom and Dad worked hard at it, and chilies kept them profitable. My Dad started us farming young," he said. "When I was just eight, my Dad was looking for a better chile and I flew with him to New Mexico to a seed farm. That made a big impression on me and I became interested in genetics at a young age."

He went to Elfrida High School and then on to one semester of college, but he really didn't enjoy learning at a desk. So, he turned to his passion for chilies, and started to build his own education. "I wanted to do more than just grow chilies; I wanted to breed chilies. It was a challenge," he said, and his desire grew into a lifelong interest in chile genetics.

Now, Curry, at 53, is internationally known for his work in chile genetics. He has just filed a utility patent on a chile that he and his partner, Phil Villa, bred. The 'Phil Villa' chile pepper, as he calls it, "has very unique properties and flavor. To file for a utility patent on a plant, you have to show extreme differences and specific value. It's a very difficult thing to do," Curry said. "I am also currently working with a group doing the Genome mapping for peppers - making descriptions of every gene in peppers. There are five scientists tied to it and the project costs about $30 billion," he said.

But let's back up a bit.

In 1986, Curry started the Curry Seed and Chile Co., now a 1,200-acre farm in the Sulphur Springs Valley near Pearce. Curry said most of his knowledge of genetics came from working with his former teacher and current partner, Phil Villa, a well-known chile breeder. Others who helped him learn were Jeff Silvertooth of the University of Arizona; Ben Villalone of Texas A&M - known as 'Dr. Pepper' for "taming" the jalapeno, and Stephanie Walker of New Mexico State University, among others. "I have spent the last 30 years trying to understand gene traits - and I still don't have near the knowledge I need," Curry said.

For many years, he has worked on developing new and improved hybrids that are now produced with uniform quality, flavor and heat. "In 1993, we were the first to stabilize heat in the commercial chile industry. Once you learn how, it's not hard to do," he said.

Then about eight years ago, Curry was asked by Mexico's Department of Agriculture to improve the yield of the Guaillo pepper. "I doubled the yield and kept the unique flavor of the Guaillo," which is a popular Mexican pepper with high oil content used for drying, he said.

In another pepper, Curry has developed a thin-skinned cross. "By making the epidermis of the chile thinner (for roasting purposes), this has made a 10-percent difference in sales in the industry and several millions of dollars per season," Curry said. "This allows people to start eating the skin, which has more nutrients."

"We have a patent pending for this new thin-skin variety," he added. Curry summed up his work: "We're playing with gene packages."

In 1995, Curry was asked to attend the Asian Vegetable Research & Development Center in Taiwan, where he was invited to swap genetic material, which PhDs use for breeding work. "I came back with the specific gene I was looking for," he said. "I was very honored to be there. This center is supported by the United Nations and there are 7,000 cultivars pep..."
per in the seed bank there."

Curry said, "In third world countries, most of the farms are very small - often one acre - and they're trying to keep up with
growing populations. The numbers of acres of farmland are shrinking and the population is growing. It is the job of the agri-
culturists to feed the world. Nutrition and high yield are important. That is why genetic breeding is important."

Locally, the Currys hosted their fourth Field Day in September 2009, where about 70 researchers from the Southwest (and
elsewhere in the U.S.) come to his farm to study the genetics of the chili industry. The genetic origins for 80 to 90 percent
of the New Mexico variety green chilies grown commercially in the U.S. can be traced back to Curry's farm in Arizona, he
said, as the Curry Seed & Chile Company supplies chile seed to growers in the Southwestern U.S. and in several states in
Mexico. "We're at the heart of chili research," he said.

"There's great joy in that, however I always worry about making a mistake. I could screw up and that could affect 90 per-
cent of the industry," he said. In 1996, he partnered with Jeannie England at the Santa Cruz Chili & Spice Co., a manufac-
turer and retailer of chili products. He said his father and Jeannie's father (Gene England) had worked together since Gene
started the company in 1943.

His chile paste is canned at Curry's Farm in Pearce and he sends it to Santa Cruz. It ends up at several big-name compa-
nies. And, Curry's hot pepper mash ends up at Tyson Foods for hot wings. "Our farm is one of the few seed-to-shelf
farms. We do the genetics, grow the crops in the fields, and then all the processing and canning right here," he said. Chile
research is not only for the food industry, however.

Capsaicin is the ingredient found in different types of hot peppers that makes the peppers spicy hot. When a capsaicin
cream or ointment is used on the skin, the capsaicin helps relieve pain by first stimulating and then decreasing the intensity
of pain signals in the body. "The capsaicin is formed at the top of the placenta where the seed is formed and it can be
used for anesthesia - it deadens the nerves. The chile industry is on the cutting edge in bio-pharmaceuticals. In the work
that I am doing (generally, making genetic selections based on Scoville heat unit measurements for peppers and the five
genes that make up capsaicin), I had to sign a silence agreement," Curry said.

Created in 1912, the Scoville heat unit is the closest thing to a standard for measuring the heat in a pepper. It is a meas-
urement that involves adding sugar to a solution until one can no longer taste the pepper. The more sugar, the higher the
spice, the greater measurement in Scoville units. "I'm 53 and my kids think I can eat fire! I've spent 30 years tasting chilies
- it deadens the nerves over the years, so I really can't taste the heat as much. That's what we've found out for local anes-
thetics, as well," Curry said, adding if you walk into the area where the chile is crushed, the atomized capsaicin "is great
for a sinus headache."

"Over the next 30 years, there will be a lot more usage of capsaicin medicinally," he added.

Curry is a bit surprised by his status at this point. In September 2008, he was the guest speaker at the International Pep-
paper Conference held at Rutgers University in New Jersey. "I was this farm boy talking to a bunch of doctors!" he said, ob-
viously amazed at his own predicament.

Curry and his wife Jeanette have four children currently at home, Keiffer, Mikey, Jordan and Tyler, who is running part of
the farm: "We may be Curry & Sons Farm one day," he said.

While speaking to members of several FFA chapters who visited Curry's farm in October, he said, "If I can inspire one of
you to study genetics, it's worth doing this. Gene manipulation is what will hold our world together and keep us from being
hungry. And I'd like to keep America in the forefront of this industry. "But, I enjoy speaking and encouraging young folks.
And I tell them, whatever you do, you've got to have passion for it. Education never stops. We are searching every day for
something to uncover. So, if there's one thing I can pass on, it is, love what you do.

"For me, my heart is here on my farm. I put what profit we make back into my research — it is my hobby, my passion. Peo-
ple go on vacation, or love fishing. For me, I don't have to go to the mountains to have fun. It's here. The farm and my re-
search … it's my life."

Temple Grandin’s innovative work has revolutionized animal husbandry practices around the world.

Temple Grandin takes new angles to solve modern problems

By Richard Deitsch
When discussing her age recently—she turned 65 last August—Temple Grandin compared herself to a creaky automobile that needs constant tinkering. “I used to be able to stand in a forklift truck loading dock at a feed yard and I could jump up on the ramp,” she says. “Gosh, there is no way I could do that now. But one of the things that getting older does give you is wisdom and a perspective that you didn’t have before because you’ve been to a lot of places and you’ve seen a lot of things. That’s why, in a lot of societies, they look up to their elders. In elephant society, younger elephants look up to the matriarchs. Why? Because they know where to find the water from 50 years ago.”

Plenty of people seek Grandin for her wisdom these days. She is a doctor of animal science and professor at Colorado State University, a best-selling author, the subject of an Emmy Award-winning HBO biopic, a much-in-demand public speaker and a consultant to the livestock industry on farm animal behavior (see “Shaping Costco’s policy,” page 23). As the most well-known adult with autism in the United States and perhaps the world—she regularly makes presentations at autism and Asperger’s syndrome conferences—she is an inspiration and a role model for that community and beyond.

“It’s hard to overstate Temple’s impact as a role model for young adults on the autism spectrum,” says Amy Harmon, the best-selling author of Asperger Love and a Pulitzer Prize-winning reporter for The New York Times who has written extensively on autism. “Probably the biggest impact she has had for the population I’ve reported on, young adults on the autism spectrum, is in how she turned her fascination with animals into a rewarding career. The employment statistics for people with autism are really dismal. Fewer than one in 10 hold jobs, even among the group considered ‘high-functioning’. Yet many of them have skills and talents and interests that could be quite valuable to employers. Temple is a testament to that and an inspiration to many.”

**From isolated to expert**

Little was known about autism when Grandin was a child in the 1950s—she did not speak until the age of 4—but she benefited from the structure provided by her mother and school administrators. (Her father recommended she be institutionalized, but her mother refused.) Children with autism, a developmental disorder, have varying degrees of difficulty communicating and socializing, and often lock onto repetitive behaviors. It was at an aunt’s cattle ranch in Arizona...
Arizona one summer, during her teens, that Grandin first became connected to horses and cattle and discovered a shared characteristic between animals and those with autism: Both think by making visual associations. She eventually received degrees from Franklin Pierce College and Arizona State University, and a Ph.D. from the University of Illinois at Urbana in 1989. The public became aware of her in 1995 when famed neurologist Oliver Sacks wrote about her in his book An Anthropologist on Mars.

“Autism is an important part of who I am,” says Grandin, who has had a poster of Albert Einstein on her wall since grade school. “I get asked all the time: If I could snap my fingers, would I want to not be autistic? Well, I like the logical way I think. But on the other hand, doing my animal work and being a college professor and a scientist, that comes first. Autism comes second.”

At least half of all cattle in the U.S. and Canada, as well as many in other countries, are handled in humane slaughter systems with equipment designed by Grandin. Those designs have revolutionized animal agriculture around the globe, and Grandin has been a key figure in formulating the beef industry’s guidelines for animal handling and welfare as well as in training a new generation of agricultural professionals in animal behavior theory, humane design and auditing techniques. She consults for many companies, including McDonald’s, which first hired her in 1999 to audit the meatpacking plants that supplied the fast-food chain.

“Dr. Grandin’s work has anticipated and dovetailed with societal concerns related to welfare in animal agriculture, and as a result there is hardly a high-profile conference or symposium around the world focusing on this issue that does not include Temple Grandin,” says Craig Beyrouthy, the dean of the College of Agricultural Science at Colorado State University (CSU). “We hear stories of students who are almost dumbstruck that they can enroll in Dr. Grandin’s classes, that she might be an adviser for them as they pursue graduate studies. We have a student who came to CSU in fall 2012 from an agricultural community in southeastern Colorado, a student with Aspgerger’s syndrome who was not expected to graduate from high school. On the first day of the semester, his mother shared that the student was ‘living his dream.’ He had his first day of class with his mentor and hero, Temple Grandin.”

“Temple Grandin has helped all of us understand the power of different ways of thinking and being,” adds CSU president Tony Frank. “Her unique perspective, raw intellect and ability to see challenges and solutions from new angles, to connect dots that most of us don’t even see.”

Thinking in pictures in a verbal world

Grandin, who once believed that everybody thought in pictures as she does, says her thinking is sensory-detailed oriented. Then, how does she interact with the verbal world?

“You can get verbal thinkers to be aware of visual thinking,” she responds. “The thing is, there are degrees. Most people, if I was to say to them right now, ‘Visualize you are [at your] office at work.’ Well, you could do that. Or visualize your car. Most people can do that, too. But if I asked you to visualize something like a church steeple, something you see all the time, most people just see a vague, generalized one. That’s not something they pay much attention to. So it was a shock to me to learn that most people just got this vague, generalized church steeple image rather than a specific one. I’ve had to learn how to communicate more with the verbal people.”

Author Richard Panek met Grandin three years ago after he was invited to collaborate with Grandin on The Autistic Brain: Thinking Across the Spectrum, which was published in April. Asked what he admires most about his co-author, Panek says, “The obvious answer is the work she does on behalf of people with autism, as well as their families, but what comes to mind first is what makes that work possible—that she’s learned how the world works. She’s had to figure out how people
behave in order to modulate her own behavior accordingly, and that's the behavior that makes her work on behalf of people with autism possible."

Grandin says that watching the 2010 HBO film on her life was like traveling back in time. She saw actress Claire Danes and family tapes and spent half a day with Danes, who taped her every move and ended up winning an Emmy for her performance. "Claire Danes became me," Grandin says. "But the thing I loved is the movie showed cattle accurately, and I had a lot of input into that. It showed real cattle handling and I thought that was good for the public to see."

The film significantly added to Grandin's fame—it's cut an equally distinctive figure in the real life, with her signature cowgirl shirts, blue jeans and black boots—and she now speaks at large venues around the country.

"I've gotten moved to basketball stadiums, and that's all happened since the movie," she says. "A lot of people who come to events—I estimate 75 or 80 percent of them—are probably interested in autism. But then there is another group interested in animals. One thing I am getting concerned about is I'm seeing too many kids who are considered mildly autistic come up to me and all they want to talk about is their autism. I'd rather have them tell me about their science project or how they are training dogs or that they are in 4-H or they like to write science fiction.

Tell me about what you like to do? Autism would totally take over if I let it, but I am not going to let it."

For years, Grandin says, she was hypersensitive to sound and touch, but both have gotten manageable. "I am hugging people now," she says. "Little kids who don't want to be hugged, you need to work on desensitizing them. I'm a lot better with sound, but I still have to have a quiet place to study when I do serious writing. But I do get distracted by motion. One thing that drives me crazy is photographers walking in front of me. I tell them to stop. If there is a video camera in the back of a room that just sits there, it's no problem."

What worlds are left for her to conquer? "There are things that would be really fun to do, like go to the Space Station, but I don't think I will be doing that," Grandin says. "But if I had a chance to go for a week, I would go. Definitely." [6]

Don’t Blame Cows for Climate Change
December 7, 2009

Despite oft-repeated claims by sources ranging from the United Nations to music star Paul McCartney, it is simply not true that consuming less meat and dairy products will help stop climate change, says a University of California authority on farming and greenhouse gases.

UC Davis Associate Professor and Air Quality Specialist Frank Mitloehner says that McCartney and the chair of the U.N.'s Intergovernmental Panel on Climate Change ignored science last week when they launched a European campaign called "Less Meat = Less Heat." The launch came on the eve of a major international climate summit, which runs today through Dec. 18 in Copenhagen.

McCartney and others, such as the promoters of "meatless Mondays," seem to be well-intentioned but not well-schooled in the complex relationships among human activities, animal digestion, food production and atmospheric chemistry, says Mitloehner.

"Smarter animal farming, not less farming, will equal less heat," Mitloehner said. "Producing less meat and milk will only mean more hunger in poor countries."

Mitloehner traces much of the public confusion over meat and milk’s role in climate change to two sentences in a 2006 United Nations report, titled "Livestock’s Long Shadow." Printed only in the report's executive summary and nowhere in the body of the report, the sentences read: “The livestock sector is a major player, responsible for 18 percent of greenhouse gas emissions measured in CO2e (carbon dioxide equivalents). This is a higher share than transport.”

These statements are not accurate, yet their wide distribution through news media have put us on the wrong path toward solutions, Mitloehner says.

"We certainly can reduce our greenhouse-gas production, but not by consuming less meat and milk.

"Rather, in developed countries, we should focus on cutting our use of oil and coal for electricity, heating and vehicle fuels."

Mitloehner said leading authorities agree that, in the U.S., raising cattle and pigs for food accounts for about 3 percent of all greenhouse gas emissions, while transportation creates an estimated 26 percent.

"In developing countries, we should adopt more efficient, Western-style farming practices, to make more food with less greenhouse gas production," Mitloehner continued. In this he agrees with the conclusion of "Livestock’s Long Shadow," which calls for “replacing current suboptimal production with advanced production methods — at every step from feed production, through livestock production and processing, to distribution and marketing.”

"The developed world’s efforts should focus not on reducing meat and milk consumption," said Mitloehner, "but rather on increasing efficient meat production in developing countries, where growing populations need more nutritious food."

http://news.ucdavis.edu/search/printable_news.lasso?id=9336&table=news
Mitloehner particularly objects to the U.N.'s statement that livestock account for more greenhouse gases than transportation, when there is no generally accepted global breakdown of gas production by industrial sector.

He notes that "Livestock's Long Shadow" produced its numbers for the livestock sector by adding up emissions from farm to table, including the gases produced by growing animal feed; animals' digestive emissions; and processing meat and milk into foods. But its transportation analysis did not similarly add up emissions from well to wheel; instead, it considered only emissions from fossil fuels burned while driving.

"This lopsided 'analysis' is a classical apples-and-oranges analogy that truly confused the issue," Mitloehner said.

Most of Mitloehner's analysis is presented in a recent study titled "Clearing the Air: Livestock's Contributions to Climate Change," published in October in the peer-reviewed journal Advances in Agronomy. Co-authors of the paper are UC Davis researchers Maurice Piteskey and Kimberly Stackhouse.

"Clearing the Air" is a synthesis of research by the UC Davis authors and many other institutions, including the U.N. Food and Agriculture Organization, U.S. Environmental Protection Agency, U.S. Department of Agriculture, California Environmental Protection Agency and the California Air Resources Board. Writing the synthesis was supported by a $26,000 research grant from the Beef Checkoff Program, which funds research and other activities, including promotion and consumer education, through fees on beef producers in the U.S.

Since 2002, Mitloehner has received $5 million in research funding, with 5 percent of the total from agricultural commodities groups, such as beef producers.

**About UC Davis**
For 100 years, UC Davis has engaged in teaching, research and public service that matter to California and transform the world. Located close to the state capital, UC Davis has 31,000 students, an annual research budget that exceeds $500 million, a comprehensive health system and 13 specialized research centers. The university offers interdisciplinary graduate study and more than 100 undergraduate majors in four colleges -- Agricultural and Environmental Sciences, Biological Sciences, Engineering, and Letters and Science. It also houses six professional schools -- Education, Law, Management, Medicine, Veterinary Medicine and the Betty Irene Moore School of Nursing.

Arizona teachers become the students at Summer Agricultural Institute

BY JOYCE LOBECK, SUN STAFF WRITER
July 8, 2007 - 12:02AM

Twenty teachers from around the state recently got a crash course in agriculture in Yuma County. They were participants in this year's Summer Agricultural Institute, held annually to educate the state's educators about the scope and value of agriculture in hopes they will take that awareness back to the classroom, said Monica Pastor, a University of Arizona Cooperative Extension agent in Maricopa County and coordinator for the program.

The goal is expose K-12 teachers to the diversity of agriculture in the state, provide motivation and resources for them to incorporate it into their lesson plans and demonstrate the career possibilities for their students, Pastor said.

"Many start with no background in agriculture," she said. "But we all eat, wear clothes, have a roof over our heads. We need to keep agriculture in this country."

Hundreds of teachers have participated since the program began 17 years ago. In past years, the five-day institute has visited various areas of the state. This year was Yuma County's turn.

"We've been avoiding Yuma because of the heat," Pastor said, "but there is so much agriculture here. It is the top agriculture area for the state."

The trip proved to be eye-opening. "We had never done seed distribution," she said. "We had never seen black-eyed peas, never seen dates processed." Pastor said the group also heard about the need for more students to go into science, whether in farming or agriculture-related careers such as research and technology development.

Among the participants were two teachers from eastern Yuma County. Even they were amazed at the scope of agriculture here, and the experience has them considering the many ways they can use what they learned and the resources they were given in their classrooms.

"Even with my background, I found out new things," said Judy Newman, a longtime Roll-area resident since the eighth grade whose family has been involved in agriculture. She was particularly impressed by "all the new high tech stuff. I'm very aware of laser leveling ... and knew about GPS (Global Positioning System), but I didn't realize how much it is used in farming."

Newman also said she was familiar with produce being grown in the fields, but a tour of the Dole salad processing plant gave her a new awareness and appreciation for Yuma County's fresh vegetable

production. That's definitely an experience she wants to share with her students, many of whose parents labor in the fields, planting and harvesting the crops.

A visit to the new ethanol plant in Pinal County and presentation on the planned plant near Tacna brought the emerging industry home to Newman. "I definitely will bring some of what I learned into my classroom," said Newman, an English teacher at Antelope High School. "We were given a lot of resources. Now I have to figure out how to put them to use. I'm on the lookout for lesson and project ideas."

She's already planning a couple of field trips "to help my students become more aware of agriculture beyond the fields." She also wants to bring in people to talk about high tech in agriculture. "And it doesn't hurt to do some reading," she said. "Maybe it would be topics for research papers."

The trip also gave Newman a chance to catch up on a couple of people she had previously known. One presenter, Marcos Moore, who works for the University of Arizona, was one of her fifth-grade students. "It was nice to see him go on in the farming world," Newman said.

Each teacher spent a night with a host farming family. As it turned out, Newman's host, Mark Spencer, had been in the same 4-H club with her while they grew up in Mohawk Valley. "So we did a lot of reminiscing."

A highlight of the trip for Newman was listening to her fellow participants talk about how much the experience had changed their perception of agriculture and the people who labor to provide this nation's food. "One said she had never met so many intelligent people," Newman said. "They gained an awareness of what agriculture is about. It's not just the guy in overalls."

Sarah Rodriguez, who teaches seventh- and eighth-grade science at Wellton Elementary School, said the trip "re-energized me" and will be a big help in teaching science. "It was an eye-opening experience in how we can use our surrounding area in our teaching," she said. "Everything we observed was tied in with our curriculum and (teaching) standards. There are a lot of good ideas out there, but it's not always clear how we can tie it in. They gave us a lot of resources and even lesson plans." She also appreciates gaining a network with other teachers to share ideas.

Even though she was born and raised in Wellton, Rodriguez said she "learned so much about agriculture" and the importance of farming there to the region and nation. As a result, she not only will be able to share with her students the many opportunities in the industry, but also to help them gain "new pride in what their fathers do. Without them, we wouldn't have what we have today."

Both teachers would recommend the trip to others. "It was an inspiring week and educational," Newman said. Rodriguez expressed appreciation to her administrator for recommending her for the trip and to Wellton-Mohawk Irrigation and Drainage District for sponsoring her.

For more information, contact Monica Pastor, coordinator, at 1-602-470-8086 or mpastor@ag.arizona.edu.

New research published by Dr. Jude Capper in the Journal of Animal Science shows that beef’s environmental footprint is shrinking. Each pound of beef raised in 2007 (compared to 1977) used:

- 19 percent less feed;
- 33 percent less land;
- 12 percent less water; and
- 9 percent less fossil fuel energy.

The carbon footprint of beef was reduced by more than 16 percent from 1977 to 2007.1

Raising Beef is Environmentally Sustainable

With the world population officially hitting 7 billion people earlier this year and projected to reach 9.5 billion by 20502, farmers and ranchers must continue to find ways to sustainably feed a growing world population using fewer natural resources.

- According to Capper’s research, improvements to the way cattle were raised and fed in the U.S. between 1977 and 2007 yielded 13 percent more total beef from 30 percent fewer animals. More beef from fewer animals maximizes resources like land and water while providing essential nutrients for the human diet.

- The United Nations Food and Agriculture Organization (FAO) projects in 50 years, the world population will need 70 percent more food. Seventy percent of this food must come from efficiency-improving technologies.3

- U.S. cattlemen raise 20 percent of the world’s beef with 7 percent of the world’s cattle, making the United States a leader in raising sustainable beef.4
Reducing Environmental Inputs

According to Capper's research, much of the reduction in beef's carbon footprint is due to raising cattle on grass pasture than finishing them on an optimal, balanced diet of grasses, grains and other forages in a feedyard.

- According to previous research conducted by Capper, it takes 226 more days for grass-finished cattle to reach market weight than grain-finished cattle. More days on grass may mean greater environmental impact.
- Each pound of grain-finished beef requires:
  - 45 percent less land;
  - 76 percent less water; and
  - 49 percent less feed.

Food to Feel Good About

There are a variety of beef choices such as grain-finished, grass-finished, natural and certified organic beef to choose from. Cattle farmers and ranchers make smart use of the diverse natural resources, like water and land, available in their local areas to produce nutritious, safe and delicious beef that they're proud to serve to their own families.

- Beef is environmentally and nutritionally efficient. Each serving today requires less land, water and energy than in the past while providing 10 essential nutrients to your diet.
- All choices of beef are excellent or good sources of 10 essential nutrients and there are 29 cuts of beef that meet government guidelines for lean.
- Several of the key nutrients in beef, specifically iron and choline, are known to be lacking in the diets of many Americans, especially women and children.
- Research shows beef offers several health benefits including heart health, muscle development and weight management.

Maricopa Agricultural Center hosts Arizona educators
*Ag Institute puts teachers in field*

By GLORIA SAVKO, Staff Writer                June 28, 2007

More than 20 schoolteachers and administrators from throughout Arizona recently visited Maricopa to expand their knowledge of agriculture. All were participants in the annual Summer Ag Institute, a program presented by the University of Arizona Cooperative Extension.

Monica Pastor, associate agent for the extension in Maricopa County, said the program arose 17 years ago from a desire to bring the subject of agriculture into the classroom and to be able to do so without time restrictions and staff limitations.

"I may have gotten into a classroom one time in a school year for maybe half an hour," Pastor said. "We decided if we could train the teachers that we could have them in the classroom 180 days a year, all day long, if they wanted to incorporate agriculture into their lessons."

This year's five-day institute was held June 18-22, and encompassed hands-on activities and classes not only in Maricopa, but also in Phoenix, Yuma, Wellton and Stanfield.

On Thursday, June 21, the group visited the Maricopa Agricultural Center (MAC), a 2,100-acre educational research facility on Smith-Enke Road.

Outdoor activities included using a net to "sweep" an alfalfa field for insects, placing the insects in bags and then freezing them. Later, the group identified what kind of insects they had gathered and cataloged them as either "good" or "bad" bugs.

"(Sweeping) gives them an appreciation for how many insects they found because they go out in the field and ... they don't really see much. For every insect they see, there are probably 500 to 1,000 more they don't see," said Ed Minch, task leader and an Arizona Department of Agriculture retiree.
Participants also learned how to operate irrigation siphoning tubes and listened to presentations about cotton, plant science, the Gila River Community Project and Project WET (Water Education for Teachers).

The week's curriculum had a positive impact on the teachers. "The broad spectrum of farming and agriculture has really opened my eyes to a lot of things," said Lee Scott, a seventh- and eighth-grade teacher at Gilbert Junior High School. "We stayed with a farm family a couple of nights ago, and that was really neat because I would never have the time to just chat and get to know them. I was surprised at how much they are like me. It's been a really fun experience."

Anne Howe teaches fourth grade at Sacaton Elementary School in the Gila River Indian Community, which is home to the 16,000-acre Gila River Farms. It produces cotton, alfalfa and various food crops. "We've been asked by the tribe to work with the elementary school to get the students more interested in agriculture," she said. "I'm hoping to plant gardens and to do some kind of in-classroom agricultural activities, so that when the students get to middle school, where they have more agricultural options, they will participate in it."

Pam Petterborg, a seventh- and eighth-grade teacher at Gilbert Junior High School, said, "I'm all about food in the classroom, so I like to enhance the perspective of how food goes from the seed to the plate and all that's involved in the agricultural industry to produce it.

Mike Cox, principal of Alpine Elementary School, said he looks forward to sharing what he's learned with his staff. "It's going to help, especially with the AIMS science test coming up," he said.

Darryn Elliott, a second-grade teacher at Buckeye Elementary School, said the institute was "very beneficial."

Admission to the program is by application. The process requires a detailed account of the reasons for applying and an explanation as to what the applicant plans to do with what is learned. "We want to make sure we get good-quality teachers," Pastor said. "We accepted 22 teachers this year, and we have funding for up to 30. They pay an $85 registration fee, but it actually costs us $450 per person to present this program."

Funding is provided by the Arizona Foundation for Agricultural Literacy. Victor Jimenez, project leader for the Ag-Literacy program at MAC, said the Summer Ag Institute is one of several programs available.

"We reach all ages," he said, "from elementary school to high school through to the winter visitors and senior citizens who come from around the country."

For Dairy Farm Families, Sustainability Is A Way of Life

 Posted on June 13, 2012

 By Paul Rovey
 Arizona Dairy Farmer and Chair, Dairy Management Inc.

My father, Emil Rovey was born in 1916 on his parent’s 80-acre farm in Arizona. He milked the cows by hand, hauled their milk to the creamery in 10-gallon cans, and cultivated their crops with teams of horses and mules.

In 1943, he bought a 145-acre farm in Glendale, Arizona. He continued to acquire nearby farm-land as it became available throughout the 40s, 50s and into the 60s. He was connected to the land at an early age and would continue his involvement for the rest of his life.

Because my father was a sustainable dairy farmer, Rovey Dairy is now run by the second and third generations of Roveys. Dairy farmers have a legacy of being sustainable. It’s nothing new. It’s in our blood. It springs from an industry of people accustomed to caring for assets passed down to us for generations and a strong belief in the wholesome, nutritious dairy products we produce to help Americans eat healthfully.

That’s why it was natural for dairy producers – through Dairy Management Inc. – to help lead the industry in a sustainability commitment through the Innovation Center for U.S. Dairy. We made this formal commitment in 2008, and last year more than 800 people were actively involved in our projects. They included dairy farmers and others from dairy companies, as well as experts from academic institutions, state and federal governmental agencies, and other partners, like World Wildlife Fund.

Earthbound Farm Organic: Meet Our Farmers

Arnott Duncan calls himself a “dirt nerd.” He loves being out in the field; he says it’s his strength. He’s been farming for more than 20 years now, first with his father and brothers (he’s part of the fourth generation of his family to work the land), then on his own. Even after all these years, he still loves every moment he’s out in the field.

His wife Kathleen was a city girl from San Francisco, but she planted firm, healthy roots in the Arizona soil after she met Arnott at the University of Arizona, where they both played volleyball. Their partnership has built a thriving farm and a thriving family.

Sharing a love of farming

The Duncans farm near Phoenix, Arizona. For a time, they ran very successful public programs that helped them share the farm experience with the community in an educational and entertaining way. It seemed like a natural way to combine Arnott’s farming expertise and Kathleen’s degrees in counseling psychology and special education into a family business.

“When we first opened to the public,” Kathleen explains, “the image of farming in Arizona had hit an all-time low. People thought farmers exploited the land pretty shamelessly, just spraying chemicals all over everything with crop dusters.”

Arnott recalls the surprise he’d hear in the voices of local agriculture officials who’d call to arrange inspection visits. Just come out, he’d tell them, you don’t need to have an appointment. “I’m the first one who wants to know if we’re doing something wrong,” he says. “Just tell us and we’ll change it. That’s it.”

One ending, another beginning

Unfortunately, the Duncans had to close their public programs due to security concerns from the nearby Air Force base after 9/11. The Duncans had already been growing organically on some of their land, and they’d been planning to transition more acreage to organic when they met Todd Kodet, Earthbound Farm’s senior vice president of farming.

“You learn in farming that when one door closes, another opens,” Arnott says. “The opportunity to start growing for Earthbound Farm came along at just the right time.”

“Our public programs were such a huge investment in time and energy that maybe we wouldn’t have been able to do both,” observes Kathleen. “Today we reach many more people with our produce, and we want people to have a wonderful experience eating it.”

The Duncans are currently growing many of the baby lettuces and other varieties of baby greens that go into Earthbound Farm’s organic spring mix, as well as herbs and spinach; past seasons have seen them growing organic red cabbage, romaine, and broccoli as well.

History of the Arizona Cattle Industry

The cattle industry has been a vital part of Arizona for over 300 years. In the mid-1700s Father Kino introduced cattle into our state. For almost a century cattle flourished in the arid climate, providing early American immigrants, Indians and Spaniards with beef. The marauding Apache Indians were pacified with gifts and rations. However, after the commencement of hostilities between the U.S. and Mexico in 1846, Spanish support ceased and the ensuing Indian uprising drove miners and ranchers southward, away from Apache land.

As haciendas were abandoned, great numbers of beef animals spread throughout the hills and canyons to roam in a truly wild state. Military brigades that passed through the area commented on the huge herds of cattle and horses that grazed the Arizona ranges. They were surprised that although the gramma grass on the hills was straw colored and dead looking, the thousands of wild cattle and horses were fat.

The discovery of gold in California in 1849 created a great beef market. Still, the local industry did not revive until miners came to reopen old Spanish workings and prospect new fields. The first actual rancher is said to be William S. Oury. He began with 100 Illinois heifers and four bulls in 1858.

After the Civil War there was a tremendous stimulus to the livestock business. Unattended herds in Texas had increased while the range had declined, creating a desperate rush to relieve the overburdened grazing lands. Hundreds of discharged Texas veterans poured into Arizona. They entered Arizona four different ways: the San Pedro River, Ft. Bowie, the San Francisco River and Beale’s Road (Highway 66 and the Santa Fe Railroad route.)

As the number of cattle in Arizona grew, so did competition. The ranching industry adopted more business like methods including better blood in the herds and planned use of forage. Colonel H.C. Hooker is credited with bringing a large number of Hereford cattle to Arizona in 1884. However, Colin Cameron, established near Patagonia, ran a small group of the English breed in 1883. That winter Arizona experienced severe weather hardships, but the cattle not only survived, they were in good condition in the spring. Unrivaled rustling ability, early maturing qualities and prolific reproduction soon placed the Hereford breed in a favored position on the Arizona range.

The last years of the decade ending in 1890 were truly the heyday of Arizona’s range cattle industry. Many an indolent man with money to invest must have been attracted by the imagery that claimed: “Here the climate is almost perpetual spring and even in the driest season the feed never fails and the owner can sit under the shade of his comfortable hacienda and see his herds thrive and increase in winter and summer.”

In 1890 practically every acre of range was being occupied. Unofficial estimates by experienced ranchers showed 1,500,000 cattle located on the Arizona range. However, overstocked lands and three years of drought beginning in 1891 produced catastrophic conditions for the cattle industry.

These difficulties, harsh as they were, conferred certain benefits upon Arizona ranchers. First, the realization was brought home with emphasis that stock raising had become an involved procedure an adventure had become a business. Second, planned use of range and water was necessary. Having learned these lessons, the industry turned to more scientific husbandry and subsequently recouped its losses.

Today, Arizona ranchers continue to practice sound range ecology practices. Through improvements to the land such as adding watering sites and rotating pastures, the Western rangelands are in the best condition they’ve been in for more than a century. Almost three hundred and fifty years after their introduction into our state, cattle is Arizona’s highest valued cash commodity crop.
Arizona Dairy Farms, Cows and Sustainability

Cow Comfort
Dairy farmers genuinely care about their animals. Most dairy farmers grew up on a dairy, and absorb a sense of love and responsibility for their animals from a very young age. Arizona dairy farmers are also very clear that consumers want to purchase food from sources they know will take care of animals, and operate in a way that is consistent with their values and expectations.

In Arizona, where summer temperatures regularly exceed 100 degrees, cow comfort and animal well-being have always been top priorities. That’s why Arizona dairy herds are larger, average 2000 head, compared to a national average of 100-150 head, and have some of the highest production levels in the country. The summer conditions have prompted dairies to take particular pains to ensure cow comfort. They use misting systems to cool the animals, with droplets so tiny they evaporate before they reach the ground, thus avoiding the creation of muddy corrals. Fans are mounted on the sides of the cow shades (structures which are located to minimize exposure to the sun), along with canvas curtains which drop down automatically when the temperatures reach a specified level; the curtains roll back up automatically when wind velocity reaches a designated limit. The cow shades are typically installed on elevated ground to increase drainage of cow waste away from the shaded areas where cows linger. When it does rain, the slope from the elevated shades also aids in draining the water away from the animals. The corrals are scraped or “groomed” 2-3 times a day, and the manure is replaced with clean, dry bedding for the cows to lie in.

Some of Arizona’s newer dairies house their animals in a barn known as a "Saudi Barn", because the design was originally crafted for the hot weather conditions in Saudi Arabia. These structures feature very high ceilings, with a ventilation gap running the length of the barn. The sides of the structure are open, and the high peak (typically 14-18 feet) enhances air flow.

As a final measure of the attention to animal well-being, Arizona dairymen consult with a veterinarian and a nutritionist. Together with herds- men and/or dairy manager, these professionals form a dedicated team to ensure that sound practices for animal well-being and cow comfort are built into the daily procedures and monitored regularly.

Sustainability - "Going Green" on AZ Dairies
For 51 years, United Dairymen of Arizona (UDA) farm families have shown responsibility for the earth and a passion for dairy. In order for a dairy to thrive, the land and environment must be taken care of. Dairy families have been "Going Green" since before the term was coined, so it only makes sense that the largest Dairy Cooperative in the state would follow in its member’s footsteps.

Since 2008, UDA has been effectively making improvements on its carbon footprint. Becoming more environmentally friendly has proven to be good for the planet and the bottom line, which is always a factor in a tough economy. Using energy efficient lighting and motion controlled sensors have contributed to an over $200,000 savings on energy costs in 2008. The addition of the combustion catalyst system (CCS) in UDA’s milk tankers decreased fuel consumption, decreased exhaust gases and increased engine life. UDA has saved over $400,000 since introducing CCS in 2008.

The first phase of a solar dairy farm project was completed in the spring of 2011 on Zimmerman Dairy. After almost two years in the making, the Queen Creek dairy is the first and only in the U.S. of its kind. The Zimmerman’s have seen their electricity bill decrease by thousands of dollars a month and feel great knowing they are more environmentally friendly.

UDA also pledged to participate in responsible building practices. All building improvements must adhere to at least one of three standards: longevity, recyclables and reducing carbon footprint. Updates like acid brick to the floors and Arco-plast to the walls and ceilings in the dairy plant will meet UDA’s 15 year longevity standard and are made from natural or recycled materials.

Arizona’s dairy farm families and UDA strive to take care of the land they live and work on. Improvements that are made now will all be beneficial in securing a healthy future for the next generation.

Animal Agriculture and Responsible Antibiotic Use

By Alun M. McClure, DVM with Hard Health Management, LP

Last month, CBS News producers created a special report on the use of antibiotics in livestock production. The piece, reported by Evening News anchor Katie Couric, is not a factual representation of the scientific, safe and careful use of antibiotics in animal agriculture. My lifetime of experience in animal agriculture makes their report seem to me biased and misleading. My parents who migrated from family farms in Oregon raised us in a small Southern California community with chickens and rabbits for meat and eggs. I worked my way through high school and college on farms and fruit orchards, a 12,000 head beef feedlot, and a university-owned dairy and milk processing plant. Professionally I have worked for 36 years with dairies, feedlots, cattle and sheep ranchers in 12 states in the U.S. and in Mexico.

Without exception I have found these owners and managers to be very concerned about the ethical treatment and welfare of their animals, including the responsible use of antibiotics. They have been interested in scientific and applied research, and have worked diligently to improve every aspect of herd health and implement management programs to prevent disease and minimize the need for the use of antibiotics.

Last week I was leaning against a fence post on a third generation family dairy farm in Arizona pondering how I might respond to the CBS report since I’d gotten word they’d be airing a story on the subject. While I was reflecting, I was watching cows returning from the milking parlor playfully loping back to their pen and rapidly placing their heads side by side through the self-locking stanchions to eat. They were voraciously consuming a well-balanced total mixed ration of locally grown forages, processed grains and agricultural by-products. They had just been calmly milked by caring professional milkers using state-of-the art milking equipment. These cows walk to and from their pen twice a day on dry, padded concrete walkways to be milked. They are bedded on clean, dry and comfortable bedding in open dry lots and under shades that protect them from the elements in the winter and cool them with water spray and fans in the summer. This family has implemented many technologies to now efficiently and humanely manage thousands of milk cows better than when they started with 40 cows years ago. These cows have never been fed antibiotics, and are only treated with antibiotics when needed to cure or prevent a bacterial infection to prevent pain, suffering and death, to enable these cows to achieve their potential to feed us and a starving world with safe, wholesome, and affordable food. That is how less than 1% of the U.S. population is involved in agriculture and can provide for the other 99% and have surplus to export to developing nations.
How are antibiotics used in animal agriculture? Besides treatment of an individual sick animal, after every possible effort has been made to successfully manage genetics, housing, environment, nutrition, feeding, vaccination and other herd or flock health practices, antibiotics may be used in feed or water to treat, control or prevent disease and to promote growth and feed efficiency. This use has been proven to improve animal health and welfare (less disease and mortality), improve growth and feed conversion (reduces bad bacteria; promotes good bacteria), and improve food safety.

I welcome open dialogue and evaluation of our agricultural production practices. It can only make us better. I do ask the evaluation to be scientific and objective, and the reporting to avoid sensationalism, hyperbole, and misleading statements aimed at inflaming opinion. The CBS News report is extremely critical of the use of antibiotics in agriculture, repeating the oft-stated but unsupported assertion that there is an alarming rise in the incidence of antibiotic resistant bacteria among farm animals. I have not recognized this as a problem in 36 years of dairy practice. Surveillance data regarding bacterial isolates from cattle by the National Antimicrobial Resistance Monitoring System does not support their claim either.

Opponents of antibiotic use in food animals claim that we don’t need antibacterials to produce meat and eggs, that their use has lead to a significant increase in antibiotic resistant bacterial infections in humans, and that their use reduces the effectiveness of human medicines. In 1999, the Heidelberg Appeal Nederland Foundation, renowned for its unbiased scientific research, conducted a study on the effect of antibiotics used for growth promotion in food animals, and concluded that there was no conclusive evidence that their use contributed to human disease or compromised the efficacy of related antibiotics in human medicine.

After growth-promoting antibiotics were legislatively banned in food animals in Denmark in 1999 in an attempt to protect public health from antibiotic resistance, there has been no reduction in the incidence of antibiotic-resistant hospital isolates in humans. In some cases resistance has increased and the incidence of some types of infections in humans has also increased. Unfortunately, disease and mortality have increased among animals, producing adverse animal welfare conditions. As a result, to treat the higher incidence of disease in animals in Denmark, it has been necessary to increase the use of antibiotics for therapeutic treatment in animals. The use of antibiotics in humans has also increased. The increased health costs and labor and the reduction in growth and feed conversion in pigs have resulted in increased production costs of $5.29 per pig.

Some purport that antibacterial-free farming makes food safer. The truth is that antibiotic use in food animals makes them healthier which makes our food safer. Chickens raised without antibiotics are three times more likely to carry bacteria that can make people sick. When the EU phased out certain antibiotic uses there was no discernable improvement in food safety. Food handling and preparation has a much greater impact on food safety. In the U.S., food-borne pathogens decreased by 15 to 49% from 1996 to 2001 following the implementation of the new FSIS/HACCP (Food Safety Inspection Service/Hazard Analysis Critical Control Points) regulations. Proper food handling and cooking prevents human infection by food-borne pathogens.

Some bacteria are naturally resistant to certain antibiotics; others acquire resistance by genetic mutation over time; and some acquire resistance after exposure to an antibiotic used in human medicine or animal production. For a person to have an antibiotic treatment failure due to acquiring a foodborne bacterial disease from eating, for example, pork, the following things would have to happen:

- The antibiotic would be used in the animal;
• The animal would have to develop a resistant bacterial strain;  
• The resistant strain would have to survive through food processing/handling;  
• The resistant strain would have to survive through food preparation;  
• The resistant strain would have to transfer to the human;  
• The resistant strain would have to colonize;  
• The resistant strain would have to cause a disease; and  
• The antibiotic treatment would have to fail.

What is the probability of a person experiencing a treatment failure due to antibiotic use in swine? Here are some risk comparisons:

<table>
<thead>
<tr>
<th>Risk Comparison</th>
<th>Annual Probability</th>
</tr>
</thead>
<tbody>
<tr>
<td>Being struck by lightning</td>
<td>1 in 550,000</td>
</tr>
<tr>
<td>Dying from a bee sting</td>
<td>1 in 6 Million</td>
</tr>
<tr>
<td>Dying from a dog bite</td>
<td>1 in 18 million</td>
</tr>
<tr>
<td>Acquiring resistant campylobacter from macrolide-treated swine</td>
<td>&lt; 1 in 53 million</td>
</tr>
<tr>
<td>resulting in treatment failure</td>
<td></td>
</tr>
<tr>
<td>Acquiring resistant <em>E. faecium</em> from macrolide-treated swine</td>
<td>&lt; 1 in 21 million</td>
</tr>
<tr>
<td>resulting in treatment failure</td>
<td></td>
</tr>
</tbody>
</table>

It’s easy for me to say that antibiotic resistant bacteria are not a problem when I haven’t personally experienced such an infection, but that’s meaningless to a person who has. It’s like trying to console a person who has been unable to find work for six months by informing them that the national unemployment rate is only 10%. In fact, while competing in high school athletics my daughter got a nasty skin infection on her leg caused by antibiotic resistant staphylococcal bacteria (MRSA). A few months later my wife got a lip infection caused by the same type of bacteria. These infections did not come from animal agriculture nor did the antibiotic resistance. The resistance is real but many scientists believe the primary cause is misuse (over prescribing) of antibiotics in human medicine and/or failure of patients to complete the prescribed regimen.

Antibiotic use in animal agriculture is by or on the order of a licensed veterinarian using antibiotics approved by the FDA, having passed its stringent testing requirements for efficacy and safety (for animals, our food and the environment). All major industry associations have established prudent drug usage guidelines: the American Veterinary Medical Association, American Association of Bovine Practitioners, American Association of Swine Veterinarians, American Association of Avian Pathologists, National Chicken Council, National Pork Board, National Cattlemen’s Beef Association, and others. These guidelines and FDA oversight insure that antibiotic use in food animals will protect animal health and welfare leading to production of safe, affordable and abundant food, critical to our U.S. food security.

Maintaining the health of U.S. herds and flocks requires agriculture producers and their veterinarians to have all approved safe and effective technologies, including animal health products, available to us. It would be a tragedy for misconceptions, misrepresentations or non-science based political agendas to deprive us of any valuable tools for preventing animal disease without substantial evidence of a benefit to human health.

Corporate Environmentalism is Generating Big Green

Want to Know How Charitable Donations Really Work?

By Stefanie Smallhouse
Arizona Farm Bureau Second Vice President

Having recently concluded that time of year when the dining room table was buried in paper, we pored over receipts, notes scribbled on the checkbook, cancelled checks, deposit records, and of course our charitable donations. According to Giving USA, Americans contributed a total of $307.7 billion to charity in 2008. For those donations going to environmental organizations to save anything and everything, have you ever wondered what you get for your donated dollar?

I suggest the last time you hung up your shower towel at the Holiday Inn instead of dropping it on the floor (this is code for don’t waste precious water on providing me with another fresh towel since theoretically I was clean when I dried off anyway) resulted in a more genuine investment for the environment than the check you wrote to Big Green.

Your donation to one of the big corporate environmental groups – Sierra Club, The Nature Conservancy, or Natural Resource Defense Council to name a few – most likely went to pay for litigation or buying land, but what was the on-the-ground result for conserving anything? How did the cactus ferruginous pygmy owl benefit from your generous donation? How was your dollar used to stop erosion along Arizona’s river ways, or improve water quality along the Colorado River?

In 2008, $758 million was donated to The Nature Conservancy, $43 million to the Sierra Club, and $108 million to the Natural Resources Defense Council (NRDC). The NRDC prides itself on “defeating, blocking, and freezing” through litigation any action that it deems harmful to the earth. But I was unable to find any on-the-ground work that they are doing to actively conserve natural resources. Apparently this organization is the self-appointed legal representation for Mother Nature and that’s it.

The self-appointed realtor happens to be The Nature Conservancy (TNC). Unfortunately, Mother Nature is hard to pin down, so not only does the sales commission go to TNC, but so does all the profit. For example TNC currently has land for sale along the San Pedro River in southeast Arizona acquired as 2,156 acres of contiguous farm land and now subdivided by TNC into 5 parcels with the option of splitting further into 10. This land could have remained unfragmented and seeded with native grasses, but instead has been left to a hostile takeover by invasive woody plants that use significantly more water than farm land.

Other large expanses of land have either been donated to the organization to take advantage of tax
credits or sold to TNC for less than appraised value and then in turn flipped to the federal government for more than appraised value. This organization is in the business of nationalizing private land for a profit, while shrinking the tax base for our schools and community infrastructures.

Purchasing agricultural land, beautiful landscapes, and waterways facing no eminent threat of destruction should not exactly qualify for saving anything. To other environmental groups this is considered to be focusing on “sub-national targets.” These targets generate revenue directly for the non-profit and would be very valuable on a carbon offset market. This is the same carbon market that would be created following passage of a cap and trade taxation system fiercely lobbied for by these same groups.

This type of focus results in what is called “leakage” in environmental language. A specific action stopped in one area only shifts or leaks the same action into other areas, but is in no way diminished. It does not result in any on the ground conservation work. I know of a few old mine reclamation sites that could sure use some of Nature Conservancy’s $758 million annual revenue for re-seeding and erosion control. Of course those pieces of land are neither profitable for flipping nor for carbon credits.

It’s no wonder that the spectrum of environmental groups ranging from land baron organizations like TNC to small potato radical organizations like the Center for Biological Diversity (CBD) are eating their own. CBD is trying to change policy on a national level to send us back to the 17th century, while TNC is subdividing farm land, and the Sierra Club in return for corporate cash is providing its stamp of approval on cleaning products sold as “green” chemicals to flush down your toilet. Where are your conservation dollars in all of this? Despite their differences, all of them are successfully using your donations for systematically dismantling roads, dams, logging, mining, ranching, farming, fishing, and manufacturing throughout the United States – forcing industry to move across international boundaries and oceans unregulated; All the while increasing the costs of agriculture production by those few left in this country.

Remember that shrinking tax base I mentioned before? Maybe your donation would be better spent going toward your local education tax credit to make up for the loss in property tax base to the school.

Editor’s Note: Stefanie Smallhouse is married to a fifth-generation farmer and rancher in Southern Arizona. She previously worked for a federal land management agency as a wildlife biologist, and is currently working to further conservation of Arizona’s natural resources through the locally led efforts of Arizona landowners.
It takes a group of dedicated individuals to pull together all the pieces and put on a program such as this. The Summer Agricultural Institute would like to thank the 2015 SAI Planning Committee for all their efforts to organize and coordinate the entire week of activities.
